ABSTRACT

The Pennsylvania Chapter of the American Academy of Pediatrics developed a statewide project, the Early Childhood Education Linkage System (ECELS), to provide health professional consultation, training, and technical assistance to improve the quality of early childhood education programs in Pennsylvania. The early childhood programs targeted by ECELS included over 250,000 children in Head Start programs, child care centers, family day care homes, group homes, and nursery schools. All had access to a free audiovisual library, a telephone hot line for technical assistance, linkage to local health professionals who volunteered to be listed on the project's computer registry, a quarterly newsletter on health and safety, and help in obtaining health and safety training for staff. A sample of child care programs was involved in testing the value of self-assessment to target technical assistance and the impact of linkage with nurse-consultants on improved quality of care. This report outlines the purpose of the project and its goals and objectives. A discussion of the methodology, evaluation, and results and outcomes of the sample study is presented, as well as a discussion of project publications and documents, dissemination and utilization of results, and future plans. Appendices include the study instruments, statistical data, and copies of ECELS publications. (TJQ)

PURPOSE AND RELATIONSHIP TO SSA TITLE V (MCH) PROGRAMS:

The Early Childhood Education Linkage System (ECELS) provides health professional consultation, technical assistance and training to improve early childhood education programs in Pennsylvania. ECELS is a successful state and federal, public/private partnership. The project had two Co-Principal Investigators: a pediatrician working in the private sector (Susan Aronson, M.D.), and a state agency official who was also a member of the faculty of

Pennsylvania State University (Richard Fiene, Ph.D.) The

state contributed Dr. Fiene's time to the project as an in-

II. GOALS AND OBJECTIVES: The PA AAP established ECELS in 1989 to improve the health status of children in early childhood programs in Pennsylvania. The PA AAP proposed nine objectives: 1. Establish and maintain a statewide system to link early childhood programs with sources of

health expertise to correct health and safety problems; 2. Establish and maintain a statewide structure to plan, improve and evaluate the health component of early childhood programs through surveillance, consultation, technical assistance, and training; 3. Promote control of communicable diseases by improving immunization of children and by improving sanitation practices; 4. Reduce practices leading to baby bottle mouth tooth decay; 5. Promote appropriate access to fluoride for children in early childhood education programs to reduce the incidence of dental caries; 6. Promote improved nutritional status of children in early childhood education programs by modifying inappropriate feeding practices and identifying those who are overweight or underweight; 7. Promote the use of opportunities to provide health education/physical fitness curricula for children, staff and parents in early childhood education programs; 8. Promote early and continuous ageappropriate screening linked with follow-up for children with growth problems, developmental delays, learning disorders, or emotional/social problems that may affect a child's growth, development, and social competence; 9. Promote reduction of preventable injuries in early childhood education facilities.

III. METHODOLOGY: The PA AAP designed ECELS to serve all of Pennsylvania's regulated public and private early childhood education/care facilities. To improve the quality of group

care, ECELS established five basic services: 1. Linkages between health professionals and group care facilities for young children drawn from volunteer health professionals listed in the ECELS Health Consultant Registry; 2. Telephone advice for early childhood professionals about health and safety issues; 3. A free lending library of audiovisual materials; 4. A quarterly newsletter, Health Link, distributed to all legally operated early childhood education facilities in the state and to ECELS health consultants; 5. Arrangements for health and safety training for caregivers, licensing staff and health consultants for early childhood education/care facilities in Pennsylvania. IV. EVALUATION: ECELS designed surveillance instruments to collect self-reported performance data from a sample of child care centers and family child care homes at the beginning and one year after the intervention (pretest/posttest). ECELS also collected activity data. RESULTS/OUTCOMES: ECELS successfully used individual and aggregated data collected from the sample to target interventions. Corrective actions included technical assistance, training, development of new resources, and education of makers of public policy. The child care facilities in the sample reported many improvements associated with self-assessment and access to statewide services available from ECELS. However, for certain health and safety risks, facilities linked with a Nurse-Consultant

reported greater improvement than those not linked. One shortcoming was that in both the pretest and the posttest, only 56% of the centers in the sample reported feeding practices that prevent baby bottle mouth decay. VI. PUBLICATIONS/PRODUCTS: Besides quarterly publication of Health Link, materials developed by ECELS include: several types of training curricula, a booklet for staff and consultants (Model Child Care Health Policies), a booklet for parents and staff (Preparing for Illness), a device to check immunization records (Immunization Dose Counter), a wallet-sized parent-held immunization record (Health Passport), fact sheets on childhood health problems, and forms for administration of the health component. VI. DISSEMINATION/UTILIZATION: The national AAP and the National Association for the Education of Young Children (NAEYC) agreed to distribute the Immunization Dose Counter NAEYC also agreed to distribute "Model Child nationally. Care Health Policies" and "Preparing for Illness." ECELS is working with New Jersey, North Carolina, and West Virginia on replication and provides information to other states. VIII. FUTURE PLANS/FOLLOW-UP: Now, ECELS is the primary source of activities to improve health and safety in child care in Pennsylvania. The state used Block Grants to contract with the PA AAP for the ongoing services of ECELS. SUPPORT/RESOURCES TO REPLICATE: As a statewide program, ECELS now has an operating budget of \$410,000.

Annotation:

The PA Chapter of the American Academy of Pediatrics developed a statewide project (ECELS) to provide health professional consultation, training, and technical assistance to improve the quality of early childhood education programs in Pennsylvania. The early childhood programs targeted by ECELS included over 250,000 children in 10,000 Head Start programs, child care centers, family day care homes, group homes, and nursery schools. All had access to a free audiovisual library, a telephone hot line for technical assistance, linkage to local health professionals who volunteered to be listed on the project's computer registry, a quarterly newsletter on health and safety, and help in obtaining health and safety training for staff. A sample of child care programs were involved in testing the value of self-assessment to target technical assistance and the impact of linkage with nurse-consultants on improved quality of care.

I. PURPOSE OF PROJECT AND RELATIONSHIP TO SSA TITLE V MATERNAL AND CHILD HEALTH (MCH) PROGRAMS

The PA Chapter of the American Academy of Pediatrics (PA AAP) set up the Early Childhood Education Linkage System (ECEL5), to improve health and safety in early childhood education/care programs. In 1990, ECELS began to serve an estimated 10,000 legally regulated public and private early childhood education/care programs with an estimated capacity of 250,000 children. The program lists maintained by the

state included 4,275 licensed center-based child care facilities (facilities for more than 6 children) and 5,725 registered small family child care homes. Among the center-based facilities were 529 group homes (large family child care homes for 6-12 children), 802 nursery schools, 2,884 child care centers, and 60 Head Start programs. In Pennsylvania, small family child care homes serving fewer than four children are legally unregulated.

About a third of the population under five years of age is enrolled in an early childhood education program at any given time. By the time they enter school, nearly 80% of young children have participated in group care. With so many young children in group care, health professionals who collaborate with early childhood educators find many opportunities for health promotion. The mainstream of the health profession has already focused on control of injuries and infectious disease in these settings.

The Maternal and Child Health Bureau provides leadership to both the public and private sector to build the infrastructure for the delivery of health care services to all children (and mothers) in the Nation. The Bureau's

Dawson DA, Cain VS. Child care arrangements: Health of our Nation's children, United States, 1988. Advance data from vital and health statistics; no 187. Hyattsville, Maryland: National Center for Health Statistics. 1990.

program of Maternal and Child Health Improvement Projects supported ECELS as a demonstration of innovative service to young children in group care settings. This project was funded under the 1989 MCHIP "Priority for Early Childhood Health: IV. Child Health and Safety Programs in Child Care Settings."

II. GOALS AND OBJECTIVES

The PA AAP established ECELS as a public/private partnership at the state and local level to improve the health and safety of young children in early childhood education/care facilities in Pennsylvania. In 1989, the PA AAP proposed nine objectives:

- 1. Establish and maintain a state-wide system to link early childhood education/care facilities with sources of health expertise to correct health and safety problems.
- 2. Establish and maintain a state-wide structure to plan, improve and evaluate the health component of early childhood education/care facilities through training, technical assistance, and resource development.
- 3. Promote control of communicable diseases by improving immunization of children and sanitary practices.
- 4. Reduce practices leading to baby bottle mouth tooth decay.
- 5. Promote appropriate access to fluoride intake for children in early childhood education/care programs to

reduce the incidence of dental caries.

- 6. Promote improved nutritional status of children in early childhood education programs by modifying inappropriate feeding practices and identifying those who are overweight or underweight.
- 7. Promote the use of opportunities to provide health education/physical fitness curricula for children, staff and parents in early childhood education programs.
- 8. Promote early and continuous, age-appropriate screening linked with follow-up for children with growth problems, developmental delays, learning disorders, or emotional/social problems that may affect a child's growth, development, and social competence.
- 9. Promote reduction of preventable injuries in early childhood education/care facilities.

III. METHODOLOGY

Planning: On April 11, 1989, Immediate Past-President of the PA AAP (Susan Aronson, M.D.) and the Nursing Consultant from Region III Department of Health and Human Services (Jane Courey, M.S.,R.N.) convened a meeting of a statewide steering committee for the project at the Region III offices of HHS. The steering committee included representatives of Pennsylvania public and private health professionals, Head Start and child care providers. Later, ECELS expanded the Advisory Committee to include more representatives of state

government and private agencies, early childhood education professionals, and health professionals. (See Appendix A for a list of types of representatives on the ECELS Advisory Committee.)

The project had two Co-Principal Investigators: a pediatrician working in the private sector (Susan Aronson, M.D.) and a state official who was also a member of the faculty of Pennsylvania State University (Richard Fiene, Ph.D.) Members of the ECELS Advisory Committee not only advised ECELS about performance criteria for early childhood education/care programs, they also offered the resources of their agencies and professions to solve deficiencies identified by ECELS. At annual day-long meetings, ECELS reported on progress made since the previous meeting, and reviewed current surveillance data with the committee. Then the committee members worked in small groups to develop corrective action plans for the coming year.

Funding: In addition to the grant from the Bureau of Maternal and Child Health, the PA AAP obtained funds from the Robert Wood Johnson Foundation, Pennsylvania state government, MERCK Vaccine Division, McNeil Consumer Products and the Terri Lynne Lokoff Foundation. The state also contributed Dr. Fiene's time to the project.

Surveillance/Needs Assessment: ECELS developed selfassessment instruments from published materials, and from
draft standards being developed in a concurrent project of
the American Public Health Association and the American
Academy of Pediatrics. During the study period, ECELS
maintained surveillance for common problems in child care
settings by aggregating self-assessment data from sites in a
study sample.

Study Questions: ECELS also used data from the sample to study two questions: a) whether self-assessment and access to five basic services offered by ECELS led to improvement in reported compliance with recommended health and safety practices, and b) whether linkage with a Nurse-Consultant for a year would augment reported compliance associated with self-assessment and access to the five basic services provided by ECELS. The sample selection and evaluation design for the study are described in Section IV.

Basic Services: ECELS established five basic services:

- a computer registry of health professionals who volunteered to be linked with early childhood education/care programs in their communities;
- 2. a telephone hot line for advice about health and safety issues for early childhood professionals;
 - a free audiovisual lending library;

- 4. a quarterly newsletter, <u>Health Link</u>, distributed to all licensed or registered PA early childhood programs and ECELS health consultants; and
- 5. training for child care providers, health consultants, licensing inspectors, and staff of resource and referral agencies.

Targeted Interventions: The facilities that participated in the study sample designated one of their employees as a Health Advocate. ECELS linked a subset of the facilities in the sample with a Nurse-Consultant. Both the Health Advocates and Nurse-Consultants attended training provided by ECELS. The Health Advocates received training on how to perform the self-assessment. The Nurse-Consultants received training on how to serve as a consultant to an early childhood education/care facility. ECELS linked each Nurse-Consultant with a child health physician for back-up.

The Health Advocates coordinated submission of data and documents from their facilities. They were also their program's liaison with ECELS and with the Nurse-Consultant assigned to them. Project staff reviewed the facility's health-related forms and documents and compiled the non-compliant responses from the facility's self-assessment into a computer-generated profile. ECELS returned the computer-generated profile and an annotated copy of health-related

documents submitted by the program to the Health Advocate.

ECELS also sent a copy of this material to the linked NurseConsultants so the nurses could work with the facility on an improvement plan.

ECELS staff planned and implemented statewide interventions , for systemic problems identified by aggregated selfassessment data from the facilities in the sample. For example, statewide low compliance with the requirement for training of caregivers in first aid and other health and safety practices led to an initiative to build the capacity of the American Red Cross to deliver the ARC Child Care Course. Few facilities had adequate written health This finding led to an initiative to develop a model set of written health policies for providers to use. Both the self-assessment data and the questions received on the telephone hot line revealed the need for training of parents and caregivers on how to prepare for and manage child illness. This finding led to the development of a booklet and fact sheets that give appropriate guidelines. ECELS offered these interventions to all child care programs in the state.

IV. EVALUATION

The evaluation served three functions. First, the data collection and feedback to the participants focused their

attention on areas of non-compliance. Second, ECELS used the data generated by the evaluation as described in Section III. above to identify systemic problems and plan interventions for all child care programs. Third, ECELS used the self-assessment data to address the two study questions. ECELS was a demonstration, not a research project. However, the Principal Investigators followed a demanding evaluation protocol.

Meeting the Goals and Objectives of the Project: The investigators collected data on services provided by ECELS and measured outcomes in the study sample to evaluate how well ECELS met the nine objectives of the project.

Study Design: The investigators evaluated the outcome of the self-assessment and access to ECELS services with a pretest (1990)/posttest (1991) comparison of performance reported by center-based child care facilities in the sample. Measurement of the impact of linkage of Nurse-Consultants required comparing the reported pretest/posttest compliance of center-based facilities that had a Nurse-Consultant during the first year of the study (linked) with that of centers linked with a Nurse-Consultant only after the first year (delayed-linked). Both the linked and delayed-linked groups participated in training, collected self-assessment data, received feedback and materials

related to their site's data, and had access to telephone advice from ECELS. The hypotheses were: 1) both groups would improve, but 2) the linked group would show greater improvement than the delayed-linked group.

All the small family child care homes were linked with Nurse-Consultants. ECELS used the self-assessment data from the small family child care homes to plan interventions, but not to measure the impact of linkage.

The Sample: One of the principal investigators (Richard Fiene, Ph.D.) used the state agency lists of regulated programs to select a stratified random sample of potential participants in the study using the sampling guidelines specified by Cochran (1977). The ECELS Coordinator (Herberta Smith, P.N.P., R.N.) individually contacted potential participants to recruit them for the study. a facility refused the invitation to participate, she recruited the next site on the list.

Table 1 describes the population of sites and the history of the sample from the initial selection to the end of the project. The pretest group included nearly equal numbers of for-profit and non-profit child care centers. Most of the drop-outs among the child care centers between the pretest and posttest were for-profit facilities.

c:\wp51\ecels\tables\demgraph.tbl 9/30/93

ECELS recruited the Nurse-Consultants as volunteers from both the public and private sector. When a facility accepted the invitation to participate, the ECELS Coordinator alternately assigned the facility to one of two subsets, linked or delayed-linked. Both the Health Advocates and the Nurse-Consultants received a certificate of appreciation recognizing their participation in the project. Other than the benefit of participating in the intervention, ECELS gave no compensation to the Health Advocates and Nurse-Consultants.

Prior to the training, the ECELS Coordinator contacted the director of each facility and each Nurse-Consultant. She told the director of the facility that the site would be assigned to the linked or delayed-linked subset when the Health Advocate came for training. Based on her discussions with the Nurse-Consultants about the location of the communities where they worked, she adjusted the assignment of the facilities to the linked and delayed-linked subsets so the linked facilities would be located in the community where the participating Nurse-Consultants worked.

Besides adjustments for location, the ECELS Coordinator attempted to maximize the size of the pretest sample with last-minute substitutions for facilities that withdrew prior

to training. Toward the end of the entry of facilities into the study, one of the Principal Investigators (Richard Fiene, Ph.D.) noted that more sites were in the linked than in the delayed-linked group. At this time, the ECELS Coordinator was recruiting facilities from the western part of the state. To compensate for the imbalance in the subsets, the ECELS Coordinator began to assign more sites to the delayed-linked group. As a result, a disproportionate number of the delayed-linked group came from the western part of the state.

Instruments: (See Appendix B for copies)

Activity Report Form: On a quarterly basis, the Health Advocates and the Health Consultants returned a form to document their time and activities related to the project. These data were submitted to the Early Childhood Research and Evaluation Project Office at Pennsylvania State University at Harrisburg.

Injury Report Form: ECELS supplied multi-copy injury report forms to the participating programs during the study period. As part of the study design, ECELS asked the participating child care programs to send ECELS a copy of reports of injuries where medical care was required. Over the course of the study, ECELS supplied several thousand copies of the forms to child care facilities in the sample. However, few

facilities sent any completed injury reports to ECELS.

Several Health Advocates told ECELS that because they were concerned about exposure to legal action, they would not let the reports leave the confidential files of their facilities. ECELS abandoned analysis of injury data in this study.

Enrollment/Attendance/Symptom Record: Each facility was asked to submit monthly enrollment, attendance, and symptom records kept for each group of children in the program.

Many providers said they found the form helped them spot patterns of illness for individual children and among classrooms in their facilities.

Self-Assessment of Site Performance (ECELS-C and ECELS-FCCH): ECELS prepared two instruments from assessment tools used in an earlier study²: one for center-based programs (ECELS-C), and one for family child care homes (ECELS-FCCH). The Health Advocates received the instruments and self-addressed mailing envelopes at the time of the self-assessment training. Each instrument consisted of three sections: a questionnaire, a record check, and an observational checklist to be completed at the site. The observational checklist included all performance items that

² Aronson S and Aiken L. Compliance of child care programs with health and safety standards: impact of program evaluation and advocate training. <u>Pediatrics</u> 65:318-325, 1980.

could be directly viewed during a tour of the facility in indoor play areas, food preparation and service areas, toilet and diapering areas, other indoor areas, outdoor play areas, pedestrian areas used by children in the facility, and vehicles. The record check included items that could not be directly observed during a site tour, but should be documented. The questionnaire included items that were not likely to be either directly observed during a site tour or documented in records. In addition, the instrument directed the respondents to gather and submit all health-related documents and forms that might contain the facilities health policies.

For family child care, ECELS gave the observational checklist to the Nurse-Consultant to complete with the small family child care provider. ECELS hoped the Nurse-Consultants would use the completion of the checklist to foster a relationship with the child care provider and help the provider take the Nurse-Consultant into appropriate parts of her home. ECELS instructed the Nurse-Consultants assigned to centers to observe the operation of the program within one month after the training of the Health Advocate, but they were not required to collect any pretest data.

Respondents reported that the completion of ECELS-C required between one and two person-days. The completion of ECELS-

ERIC Full Text Provided by ERIC

FCCH required three to four hours. In the 1990 editions of ECELS-C and ECELS-FCCH, respondents noted that some items were confusing. ECELS dropped these items from the 1991 instruments. New items were added to the 1991 instruments to measure risks not assessed by the 1990 edition.

Data Collection: Early childhood programs entered the project in a phased-in fashion, so that Health Advocates received training between March and September of 1990.

ECELS organized five training groups so that all the sites to be included in the study from one of five areas of the state received training together. The Health Advocates submitted the baseline (pretest) compliance data immediately following the training, before taking any corrective action.

Quarterly, ECELS mailed the Health Advocates and Nurse-Consultants a reminder to collect and submit activity data. The facilities received the posttest instruments by mail one year after they submitted the pretest data. ECELS collected pretest data between April and December 1990; posttest data arrived between April and December 1991.

The record check required submission of the dates of immunization and preventive health services from 8 randomly selected child records per center facility and from all the records for children in the small family child care homes.

ECELS received data for 758 children in 1990 and for 783 children in 1991. When ECELS closed the data set, paired data were available for a total of 67 centers (38 linked and 29 delayed-linked) and 20 small family child care homes.

Data Processing and Analysis: The Office of Early Childhood Research and Evaluation Projects at Penn State University—Harrisburg (PSU-H) compiled and analyzed the data for the first three years of the project. The Biostatistics Division of The Children's Hospital of Philadelphia (Eric Feuer, Ph.D., Avital Canaan, Ph.D. and Chris Boardman) subsequently tabulated the ECELS-C data again, analyzed and refined the pretest/posttest comparisons and reviewed this report. Only items that were identical in 1990 and 1991 ECELS-C instrument were used for the pretest/posttest comparisons.

As soon as a facility submitted the pretest instruments, the staff of the Research and Evaluation Division of the Pennsylvania Department of Public Welfare coded and sent the data to the ECELS subcontractor (Steven Melnick, Ph.D.) at PSU-H. The staff at PSU-H reviewed and compiled the data as a computer-generated list of compliance scores for each area of the health component and a description of items where the facility was not compliant with recommended performance.

The data processing staff tabulated the documented immunization and health service data in two ways. One approach was to tabulate the numbers of children whose service dates showed they were up-to-date. The second approach was to determine whether the facility was compliant with the state's licensing practice that accepts 80% of children up-to-date as substantial compliance for the facility. ECELS used the first approach to monitor immunization completeness in the study population. The data coders used the second approach when they entered the data to determine compliance of the facility with performance criteria.

The ECELS-C and ECELS-FCCH instruments included instructions to skip inapplicable items. In such cases, the respondent selected code "9" and drew a diagonal line through deliberately skipped items. The coding staff attempted to check that items were skipped only when they did not apply. However, the instrument was self-administered, and only limited verification of skipped responses was feasible. Coding staff handled both deliberately skipped items and items with no response as not applicable, i.e. excluded from the sample for that item.

The ECELS Director (Susan Aronson, M.D.) and the ECELS Administrator (Herberta Smith, P.N.P., R.N.) independently

used written criteria for the content of child care health policies to evaluate the first twenty sets of health-related documents submitted by the facilities. The readers annotated each set of health policies with suggestions for revisions to meet the criteria. After establishing interrater reliability for the criteria, all subsequent health policies were read, coded and annotated only by the ECELS Administrator.

Sources of Bias: The study has at least four sources of bias. First, the assignment of facilities to the linked and delayed-linked subsets was not random. In some cases, facilities originally assigned to the delayed-linked group were reassigned to the linked group because the facilities were located in communities where Nurse-Consultants worked. These communities might have more resources for linked sites to use to improve compliance.

Second, a disproportionate share of the delayed-linked facilities came from the (late-entering) western part of the state. Other studies by Richard Fiene, Ph.D. found higher compliance levels among facilities in the western part of Pennsylvania. A tendency to become more compliant from self-assessment alone could diminish the affect of linkage. Third, facilities that provided matched pretest/posttest data may have been more likely to take corrective action

than those that dropped out after the pretest assessment. Facilities that remained in the study through the posttest might be more likely to show improvement than those that left the study after the pretest.

Fourth, the data were self-reported and not verified. Although ECELS urged the respondents to complete the instruments completely objectively, they may have interpreted items differently or intentionally reported inaccurately. Unfortunately, ECELS does not have the resources to explore the influence of these sources of bias on the findings.

Testing the Study Hypotheses:

Item-by-Item Analysis: For each of the 362 items on the
ECELS-C, the investigators explored two hypotheses:

Hypothesis 1: Reported compliance rates will improve between the pretest (1990) and posttest (1991) surveys for the study group as a whole.

Each item had up to 67 paired binary responses. For the sites that responded to the item, the coders entered the response from each facility as either compliant or non-compliant in the pretest and in the posttest. The appropriate statistical test for change in a paired binary

response is a McNemar Test. (See references in Appendix E.)
The investigators used the McNemar Test to determine if
there was a statistically significant improvement in
reported compliance rates from 1990 to 1991.

Hypothesis 2: The linked sites will show greater gains in reported compliance between the pretest (1990) and the posttest (1991) than the delayed-linked sites.

Each item had up to 38 paired binary responses for the linked sites and up to 29 paired binary responses for the delayed-linked sites. The appropriate statistical test to determine if the change in one set of binary paired responses differs from the change in a second, independent set is a Two-Sample McNemar Test (See references in Appendix E.) The investigators used this test to determine if there was a statistically larger improvement in the compliance rates in the linked versus the delayed-linked sites. (See Appendix E for more details on how the statistical tests were conducted. The tables in Appendix C2 describe and list data for each item by risk area. The printout in Appendix C5 is an alphabetical listing of the items with the data available for each.)

Of the 362 items in the analysis, 1 in 20 are likely to have a p value less than 0.05 based on chance alone. To control

for the overall significance level desired for the entire study, a Bonferroni Adjustment is often made. (See references in Appendix E.) If the level of significance desired for the entire study is 0.05, each test should be done at the 0.05/362 = 0.0001381 level. When such a stringent cut-off for testing is used, even fairly large differences might not be considered significant. For example, for item N4094 (breakfast foods served) the change in reported compliance pretest to posttest was from 48% to 94% among the 33 sites that served breakfast. The p value for the test was 0.00073 which would not be considered significant after the Bonferroni Adjustment.

Although p values less than 0.05 are presented in the tables in Appendix C, the reader should exercise considerable caution in interpreting any result to be statistically significant unless p < 0.0001381. Especially for hypothesis 2, this study lacks sufficient power to detect a fairly large effect after making a Bonferonni Adjustment because the sample size is only 38 for the linked facilities and 29 for the delayed-linked facilities. Given the limitations described above, the p values should be used as a descriptive (rather than an inferential) statistic to point out for which items a fairly large change was observed.

Weighted Summary Analysis: The investigators assigned the

362 compliance items from the ECELS-C to 17 risk area scales. Some items were included in more than one scale. The 17 scales were grouped into three major areas of health and safety in early childhood education/care: Injuries, Infectious Disease, and Health Promotion. The 17 risk area scales are:

<u>Injuries</u> - General, Falls, Choking, Poisoning, Fires and Burns, Emergency Preparedness, Transportation

<u>Infectious Disease</u> - Immunization, General Sanitation, Food Service Sanitation, Diapering/Toileting

Health Promotion - Documentation of Routine Health
Supervision Services, Child Development/Sexual Abuse
Prevention/Parent Involvement, Nutrition, Dental Health,
Staff Health, Written Health Policies.

A jury of two pediatricians, two pediatric nurses, and an early childhood educator rated each item in each risk area scale. The raters assigned a score of 0-5, with 5 the rating for the highest risk of death, disease or disability. The ratings were averaged and risk values assigned to the items: high risk (3) for an average rating > 3, moderate risk (2) for an average rating <3, but >2, and low risk (1) for an average rating <2.

The investigators obtained a weighted summary score for each facility for each risk area scale by summing the risk value

for those items with which the site was compliant and dividing the sum by the maximum possible score for that scale. This procedure eliminated the items coded as not applicable for that site. The tables in Appendix C1 present the aggregate weighted scores by risk area for all centers with matched pretest/posttest data and, separately, the scores for the linked and delayed-linked subsets.

To determine if the weighted summary scores for a particular scale improved from pretest to posttest, the investigators used a paired T Test for the 67 center-based facilities as a group, and for the linked and delayed-linked facilities separately. To test if the weighted summary scores for each scale improved more in the linked than in the delayed-linked facilities, the investigators used an analysis of covariance model. (See reference in Appendix E.) In the model, the posttest score was used as the dependent variable. A statistical test was conducted to determine if after adjusting for the level of the covariate (i.e. the pretest score), the posttest score was higher in the linked or delayed-linked sites.

For each of these tests, the reader should again exercise caution in the interpretation of p values. Using the Bonferroni Adjustment for the 17 scales, only a p value of less than 0.05/17 = 0.002941 should be considered

statistically significant. As in the item analysis, the p values are more appropriately used as a descriptive statistic to help point out those scales where a large improvement occurred. In addition, the weighted risk area scores offer a snapshot of compliance by area of risk across the sample as a whole and facilitate overall comparison of compliance of the linked and the delayed-linked facilities. For example, the lowest weighted risk area scores for the whole sample were: for injuries, transportation safety (57% at pretest and 62% at posttest); for infectious diseases, immunization (66% at pretest and 67% at posttest); for health promotion, written health policies (9% at pretest and 15% at posttest). (For analysis of differences between the 1990 and 1991 weighted scores for the linked and delayed-linked sites see Appendix E.)

V. RESULTS/OUTCOMES (POSITIVE AND NEGATIVE):

Activity of Health Advocates and Health Consultants: Table 2 shows the mean hours the Nurse-Consultants and the Health Advocates spent working on the project during the year between the pretest and posttest. Overall, the observed changes in performance should be viewed in light of so few hours spent by either the Health Advocate or the Nurse-Consultant.

Table 2: Median hours	_	1
Type of Activity	Nurse- Consultants	Health Advocates
meetings at site	5.17	6.88
phone calls	1.09	1.36
contacting ECELS	0.50	0.60
contacting health	1.38	3.20
providing health	2.58	4.08

Outcomes Related to the Goals and Objectives

1. Establish and maintain a state-wide system to link early childhood education/care facilities with sources of health expertise: The Health Consultant Registry is a computer data base of health professionals who have volunteered to work with child care facilities in their communities. ECELS recruits for the registry through the meetings, publications and membership directories of health

professional organizations, and contacts of the ECELS

Advisory Committee. Table 3 lists the roles of the 725

members of the Health Consultant Registry as of July, 1993.

Of Pennsylvania's 67 counties, 63 have at least one health consultant.

Table 3: ECELS Health Consultar	nt Registry - 7/93
Role	# Individuals
Pediatricians	169
Dentists	23
Family Practice Physicians	19
Nurses	377
Nutritionists	59
Mental Health/Spec. Ed.	21
Health Educators	3
Community Health Agencies	29
Pediatric Subspecialists	11
Dental Hygienists	6
Optometrists	6
Speech, Language, Audiology	2
	Total =725

2. Establish and maintain a state-wide structure to plan, improve and evaluate the health component of early childhood education/care facilities through surveillance, consultation, technical assistance, and training: The tables in Appendix C1, C2, C3 and C4 summarize the surveillance data collected by ECELS by area of risk. As is described in Section III and under the other objectives, the staff of ECELS and the ECELS Advisory Committee used the study data to identify compliance problems and design corrective actions. ECELS provided training, linkages, and improved resources where data showed a need for corrective action.

The publication of model health policies was a major initiative not described elsewhere in this report. Health policies provide a plan for overall health component improvement. Compliance with criteria for written health policies improved somewhat pretest to posttest, but the weighted summary score was still only 15% at the posttest.

In 1993, ECELS published model health policies to address this need. ECELS staff culled the best written health policies from those submitted by the study sample, and used them with national standards to develop a draft of a "fill-in-the-blank" set of model health policies. Consultants from the Health Consultant Registry, a group of 55 early

childhood educators, and the Early Childhood Committee of the PA AAP revised and field-tested many drafts. ECELS sent the final version of the model health policies to every center. A self-learning module accompanied the model health policies so caregivers who participated in adapting the policies for their facility could submit their customized version and a self-test to receive credit toward the statemandated training requirement. The model health policies are available on disk for those with word processors. Both versions are available to national users from the National Association for the Education of Young Children.

3. Promote control of communicable diseases by improving immunization of children and sanitary practices;

Immunization: The data from the study sample and informal feedback from the Health Advocates and the Nurse-Consultants suggested that early childhood educators had two problems with assuring immunization. First, they had great difficulty knowing when children were up-to-date with recommended schedules. The schedules are complex and the evaluation of a child's record is a challenging task.

Second, when children were found who needed immunization, the cost of the vaccines, inconvenient services, delays and missed opportunities by health professionals, and caregiver reluctance to exclude underimmunized children were significant barriers to compliance.

The study data and corrective actions by ECELS influenced public policy and resources for immunization promotion at a variety of levels. The state cited ECELS data in support of an emergency measles regulation. The Governor and legislators used ECELS data to support passage of Act 35, legislation that mandated coverage of vaccines by health insurance. The PA Department of Health adopted the handheld immunization record for parents developed by ECELS.

With funding and graphics support from MERCK Vaccine
Division, and technical support from the Centers for Disease
Control and the (national) American Academy of Pediatrics,
ECELS developed a device to help early childhood educators
and licensing inspectors evaluate a child's immunization
record. In Pennsylvania, ECELS distributed the Immunization
Dose Counter to every regulated child care facility, child
care licensing inspector, pediatrician, and public health
clinic. The national American Academy of Pediatrics and
the National Association for the Education of Young Children
distributed a total of 240,000 copies of the Immunization
Dose Counter.

Although overall compliance with immunization did not improve, the gain in documented immunization against Haemophilus influenzae type b (Hib) is striking. Documented Hib immunization (item RC3052) improved from 39% compliance

in 1990 to 61% compliance in 1991 (n=67, p=0.00592). ECELS heavily promoted Hib immunization to the early childhood education/care facilities because of the increased risk of Hib disease in this population.

In 1992, the Pennsylvania Department of Public Welfare adopted the surveillance technology developed by ECELS to track immunization and health service data documented in child records of licensed child care facilities. Based on the methodology and results from the study sample, ECELS helped the state child care licensing office design and implement a statewide system of immunization and health service data collection coupled with technical assistance from ECELS for non-compliant sites. As a state official, one of the Principal Investigators (Richard Fiene, Ph.D.) played a key role in the inclusion of this technology in state operations. Pennsylvania has already noted improvements in the levels of documented preventive health services over the first nine months of the new system.

To launch the new system, ECELS provided training for the state licensing inspectors and data processing staff in the Department of Public Welfare (DPW) on how to sample child health records and evaluate documented immunizations and other preventive health services. During their annual licensing visits to child care centers, the licensing

inspectors conduct an on-site evaluation of the facility's compliance with state regulations. Afterward, they forward a copy of the immunization and screening dates obtained in their audit to DPW's state-level office. There, state personnel tabulate the data on a quarterly basis for each of four regions of the state. The tabulated data are analyzed by ECELS and forwarded by DPW to the Pennsylvania Department of Health. Figure 1 compares the immunization data collected from the ECELS sample pretest to posttest with data from facilities inspected by DPW during the second quarter of 1993.

100% 80% 60% 40% 20% 0% DTP POLIO MEASLES MUMPS RUBELLA HIB 1990-ECELS 89% 90% 86% 84% 85% 70% 1991-ECELS 73% 80% 90% 85% 86% 79% 1993(2)-DPW 🔯 83% 83% 85% 84% 84% 83%

Figure 1: Children with Up-to-date Immunizations

1990 = 758 child records from 125 sites, 1991 = 783 child records from 87 sites (ECELS) 1993(2) = 4,423 in 907 sites (DPW)

The reduction and recovery of documented DTP immunization levels associated with the media scare of 1990 and continuing improvements in documented Hib immunization are evident in Figure 1. Since 1990, documentation of up-to-date immunization in licensed centers has improved.

In 1993, ECELS began to use the data compiled by the state to offer linkage with a local health professional to facilities where the licensing audit found incomplete documentation of immunization and preventive health services for children in care. The health consultant linkage is both to improve documentation and, where appropriate, help families identify a source of primary pediatric care (a "medical home") where children can receive preventive care.

Family child care homes are not routinely visited by state inspectors in Pennsylvania. However, in 1993, ECELS sent a video prepared by the American Academy of Pediatrics and immunization checking tools developed by ECELS to every registered family child care provider in the state. ECELS gave providers who correctly assessed the immunization records of children in their care a certificate of credit that could be applied toward the state-mandated training requirement. ECELS also offered to link small family child care providers with a health consultant when corrective action was needed.

The lowest level of compliance with documentation of up-to-date immunization reported in the ECELS sample was for Hib (63%) in nursery schools. Pennsylvania does not require nursery schools to obtain evidence of immunization for attendance. Head Start has a mandate and dedicated staff who are required to assure that children in care are fully immunized. Except for nursery schools, ECELS immunization data did not show that Head Start programs differed significantly from the performance of other types of child care centers.

Levels of documented immunization in the 1993 sample collected by the licensing inspectors were higher than those observed for preschool children in the general population, but not as high as those reported by the Centers for Disease Control and Prevention for children in child care settings nationally. Discussions between the ECELS Director and the staff of the Immunization Division of the Centers for Disease Control revealed that the CDC reports the immunized status of children at two years of age. Except for Haemophilus influenzae type b vaccine (Hib), ECELS measured up-to-date immunization status at the age when the vaccine was due plus one month for every child, including infants. ECELS dose-counting also differed from the CDC approach by including as compliant those children who started immunization late and who were following the delayed-

immunization schedule. ECELS considered immunization against Hib by 20 months of age as evidence of compliance in 1990 and 1991. Now, DPW uses the same standard for Hib as for other vaccines (due-date plus one month).

Improved documentation of immunization was the result of activities both within and outside the project. The activities of ECELS were only one part of the national immunization campaign. ECELS featured immunization requirements for children and adults in many issues of the quarterly newsletter, Health Link. The PA AAP developed public service announcements featuring the wife of the Governor, and sent out large quantities of print materials via ECELS. The PA AAP also mailed materials to benefits managers in the corporate sector, and to many health professionals.

The Director of ECELS co-chaired an Immunization Task Force as part of her role as a member of the Governor's Commission for Children and Families. The immunization data collected by ECELS played a key role in the work of this task force, including support for PA Act 35, the legislation that mandated insurance coverage of vaccines in Pennsylvania. Immediately following passage of Act 35, ECELS sent posters to every child care provider to inform parents about the new resource.

Pennsylvania's child care licensing and management agency now includes immunization information in the parent brochure that will be distributed through the state's resource and referral agencies. This action was a direct result of the dissemination of the ECELS data. ECELS has become a primary source of health and safety consumer education in Pennsylvania.

Food Service Sanitation: The weighted Food Service
Sanitation score shows compliance improved for the sample as
a whole from 74% pretest to 86% posttest (n = 67, p =
0.0002). The association of improved food service sanitation
with self-assessment is a valuable finding. In
Pennsylvania, sanitarian inspections of child care
facilities are rare. In 1991, 41% of 37 responding linked
facilities and only 21% of 29 responding delayed-linked
facilities reported that they had obtained written approval
from an inspection by a sanitarian (item ES1015e).

Item ES4017 measured the use of a sanitary procedure to wash dishes and utensils. Reported compliance improved from 69% pretest to 87% posttest for the sample as a whole (n = 45, p = 0.00781). On this item, improvement could easily be attributed to self-assessment, since the correct procedure to be followed was described in the data collection instrument.

Item ES4021 checked that the same board is not used for raw and cooked foods. Reported compliance on this item improved from 19% pretest to 58% posttest (n = 43, p = 0.01294). Both linked and delayed-linked gained equally in this measure. However, the linked sites gained 19 percentage points in their reported compliance score on item ES4011, using only non-porous cutting boards, while the delayed-linked group did not gain at all (p = 0.01284).

Diapering/Toileting: For item ES4060, cleaning and sanitizing the diaper changing surface after each use, reported compliance for the sample as a whole improved from 75% pretest to 100% posttest (n = 40, p = 0.00195). In the posttest, for item ES4059a, the diaper changing table having an impervious surface, the reported compliance for the linked group was 92% (n = 26), and for the delayed-linked group only 45% (n = 21). Reported compliance with item ES4055, sanitary use of training chairs, increased from 33% pretest to 67% posttest, but the small sample of sites that used training chairs at all did not have sufficient power for statistical significance of this change.

Enrollment/Attendance/Symptom Records: ECELS collected data on attendance and symptoms for individual children in specific classrooms from 32 sites, including 110 classrooms between the beginning of 1990 and the end of 1991.

Dale Tavris, M.D., M.P.H., State Epidemiologist in the PA Department of Health conducted an analysis of a subset of the submitted data. These data show classroom variation within a site independent of age group, seasonal and agespecific trends that raise questions for future research.

- 4. Reduce practices leading to baby bottle mouth tooth decay: ECELS emphasized the hazard of putting feeding bottles in cribs or beds or allowing children to carry them around with them in the initial training of Health Advocates and Health Consultants, and in the ECELS newsletter.

 Reported compliance with appropriate bottle feeding practices (item DH4062) was only 56% at pretest and did not change at posttest. State regulations require that children are not allowed to sleep with bottles in their mouths. This regulation permits bottles in bed until a child is fully asleep and does not preclude prolonged bottle feeding in or out of bed. Inappropriate bottle feeding is a common practice because it soothes unhappy children. This practice is highly resistant to change by education alone.
- 5. Promote appropriate access to fluoride intake:

 During the study period, the Department of Health abruptly stopped distributing fluoride supplements to child care and eliminated all their dental health positions. Despite this

set-back, reported compliance improved for item DH2240, whether the facility knows that children receive fluoride either in their drinking water or in supplements given at home or in the program. Pretest compliance was only 10%, but by the posttest, reported compliance improved to 65% (n = 49, p = 0.00000). Both the linked and delayed-linked groups showed comparable gains. Achieving compliance required only advocating for children to receive fluoride, not necessarily giving it. Since 40% of Pennsylvania lacks fluoridation of drinking water, many children need attention paid to this issue.

6. Promote improved nutritional status of children in early childhood education programs by modifying inappropriate feeding practices and identifying children who are overweight or underweight: ECELS addressed this issue by measuring a) the adequacy of the foods served by the program and b) the extent to which child care centers had obtained growth data on children in their care. In both, compliance improved within the sample.

The weighted nutrition score improved from 65% in the pretest to 77% in the posttest (n = 67, p = 0.0001). Both the linked and delayed-linked facilities gained, suggesting that self-assessment played a role in educating them about desired practices. The only item showing differential

improvement for the linked facilities was N4064a. This item measured whether formula was brought to the program only in factory-sealed containers. Reported compliance improved for the linked sites from 17% pretest to 39% posttest while compliance for the delayed-linked sites decreased from 15% pretest to 8% posttest (n = 31, p = 0.01480)

Documentation of growth measurements was a part of the audit of the child health records. Documentation of height was checked in item RC3039 and of weight in item RC3038. Facilities that were linked with Nurse-Consultants improved by 34 percentage points pretest to posttest while reported compliance of facilities without Nurse-Consultants decreased pretest to posttest by seven percentage points (p = 0.00197). A similar pattern of change was observed for documented height measurements.

7. Promote the use of opportunities to provide health education/physical fitness curricula for children, staff and parents in early childhood education programs: In the pretest instrument, respondents responded to an open-ended question about education and training activities at their facilities. In the posttest instrument the respondents coded specific topics and targets of planned health education activities. Because of differences in data collection pretest to posttest, only the posttest results

were tabulated. (See items TR2312a through TR2320d in Appendix C3, ECELS (1991) New Item Compliance.)

Overall, half to two-thirds of the sites reported providing parent education on most of the health topics. Exceptions were low levels of parent education in first aid for children (37%, n = 65), caring for ill children (42%, n = 66), nutrition (42%, n = 64) and child abuse (35%, n = 65).

Staff and volunteer education showed the highest levels of compliance, generally above 75%. Exceptions were that 67% reported providing training in parent involvement (n = 66), and 72% reported providing nutrition training (n = 67).

Overall, reported health education activities for children were much lower than expected of a child development program. Only 49% of sites reported addressing preventing infection with the children (n = 66); only 55% taught preventing injury (n = 66), 14% taught first aid (n = 64), 52% taught nutrition (n = 66), and 25% taught preventing child abuse (n = 64).

ECELS fostered planned health education by including a suggested calendar of activities, offering appropriate support materials in each issue of <u>Health Link</u>, and encouraging use of telephone advice from ECELS. Many

facilities requested help from ECELS for answers to specific technical questions. Many facilities asked ECELS to arrange staff, child and parent education. By the end of the project period, ECELS was receiving approximately 300 telephone calls per month on the project's 800 and local numbers. Of these, more than half were requests for technical assistance. The others were requests for materials, including about 50 audio-visual loans per month. As shown in Table 4, these requests increased steadily from 1990 to 1993.

Table 4: ECELS Technical Assistance					
Type of Request	FY 1990	FY 1991	FY 1992		
technical consultation	703	983	1,956		
audiovisual materials	214	321	461		
print material only	231	433	2,604		

The staff of ECELS reviewed approximately 10 videos and print materials for each purchased for distribution. At the

end of the project period, the ECELS audiovisual library held multiple copies of 49 titles. The project maintained over 140 different print materials either developed by ECELS or purchased for single copy distribution from other sources.

At the end of the project period, the circulation of Health
Link was 15,500 copies quarterly. Recipients of the
newsletter included over 12,000 early childhood programs in
Pennsylvania, health professionals willing to assist these
programs, and policy makers whose work relates to early
childhood education programs. The county agents of the
Penn State Extension Service linked their resources with
ECELS by gathering contact information for legally
unregulated early childhood programs to whom ECELS sent
Health Link also. Agencies within and outside Pennsylvania
not eligible for free copies of Health Link could subscribe.
A total of 104 individuals not otherwise eligible to receive
Health Link subscribed.

In item FA2241, ECELs monitored first aid training of caregivers in the study sample. Pretest to posttest, facilities in the study reported a sharp drop in compliance with caregivers having completed a first aid course in the past three years (91% to 25%) (n = 67, p = 0.00000). To address this deficiency and the ongoing need for entry-level

and continuing education of child care professionals, ECELS built the capacity of the American Red Cross (ARC) to deliver child care training in Pennsylvania.

In 1990, two factors restricted the use of the nationally endorsed ARC Child Care Course: lack of certified instructors and lack of financing to pay the cost of the course. ECELS arranged for training and certification of 108 new ARC Child Care Course Instructors. Certified instructors and early childhood program staff were linked by ECELS with local chapters of the ARC. Since 1990, ECELS arranged delivery of nearly 6,000 units (of three to 7.5 hours each) of ARC caregiver training statewide. The most popular (and most costly unit to deliver) in the ARC CCC is Infant and Child First Aid. This unit includes choke-saving and rescue breathing and requires 7.5 hours. The other six units require about three hours each. ECELS also helped Penn State University plan for delivery of the ARC Child Care Course for college credit.

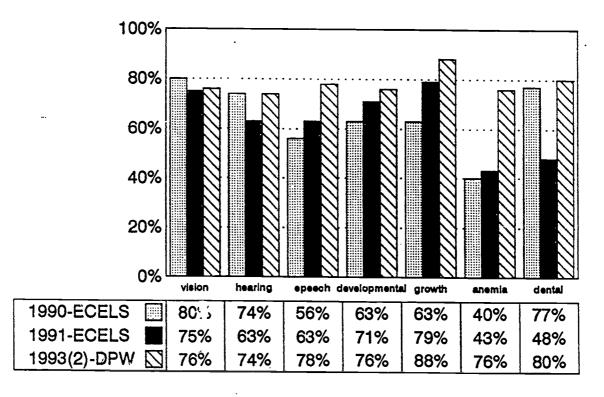

ECELS provided training for early childhood educators with presentations at many conferences. The project provided consultation to 24 leaders from other states and the District of Columbia on implementation of aspects of ECELS. The presentations and publications of ECELS are listed in Appendix D.

8. Promote early and continuous age-appropriate, screening linked with follow-up for children with (health) problems: The data collected for documented screening tests for individual children in the sample are presented in Figure 2.

Figure 2: Children with Up-to-date Screening in Child Care Centers

1990 = 425 child records from 57 sites, 1991 = 424 child records from 57 sites (ECELS) 1993(2) = 4,423 child records from 907 sites (DPW) (Facilities with data in matched pretest/posttest sample, Head Start sites excluded)

DPW adopted the surveillance techniques for immunization and other routine preventive services developed by ECELS as discussed under objective 3 above. Figure 2 summarizes the

individual record audits conducted by ECELS and compares the results with the data collected during the second quarter of 1993 as part of the licensing inspections. Little change was observed between 1990 and 1991. However, a trend for improvement can be seen in the data collected by DPW in the second quarter of 1993.

Gains in reported compliance with screening recommendations from the ECELS study sample to the more recently collected DPW sample are particularly striking for anemia and dental services. Many factors contributed to the trend for improved compliance with screening. ECELS data were used to advocate for increasing the Medicaid (EPSDT) fees and the passage of legislation providing health insurance for young uninsured children (Act 113). During the project period, EPSDT fees were increased and many more children began to be screened. PA Act 113 (health insurance for uninsured children) was enacted in April 1993, too late to have influenced these data.

9. Promoting reduction in preventable injuries in early childhood education programs: ECELS designed The Injury Report Form to help participating sites maintain surveillance. Although the form included a copy for ECELS, as previously indicated, few providers sent these to ECELS because they were concerned about exposure to liability

suits. However, providers requested thousands of copies of the form, suggesting that the document was being used at the program level. This observation was supported by the ECELS pretest/posttest data that showed a gain in reported compliance with maintenance of an injury log (item ES3140) from 48% in the pretest to 77% in the posttest (n = 64, p = 0.00004). Furthermore, reported compliance with review of injury records within the past six months (item ES2253) improved from 19% in the pretest to 79% in the posttest (n = 63, p = 0.00000). No difference in improvement was noted between the linked and delayed-linked sites for these items.

Providers also reported improved compliance with a documented site-self inspection within the past month, from 24% pretest to 47% posttest (item ES3136, n = 58, p = 0.01916).

In the weighted summary scores, the scores for general injury risk, falls, and poisoning all improved from pretest to posttest. The items contributing to these improvements are shown in Appendix C2. Reported compliance improved for safe slide ladders (linked sites), children not present when the exterminator applies chemicals (all sites), hot water temperature < 110 degrees (linked sites), and electrical outlets covered (all sites).

Transportation risks were addressed by collaboration between ECELS and another funded project of the PA AAP, The Traffic Injury Prevention Program (TIPP). TIPP gave ECELS bike helmet information and discount coupons to send to child care sites to address low compliance in this area (item T4231a). Low compliance with use of seat restraints on travel to and from child care (item T4241b) was addressed with publicity about PA restraint laws, and curricular activities for use at child care program sites.

Linked facilities reported higher compliance on item ES4059b, changing tables are sturdy, adult height and equipped with a railing (not an easily contaminated strap) to keep the child from falling. The reported compliance for the linked group was 85% (n = 26), and for the delayed-linked group 62% (n = 21).

Small Family Child Care Homes: Only 20 small family child care homes submitted matched data sets for 1990 and 1991. With limited resources for data analysis, a pretest/posttest analysis of the ECELS-FCCH data was not done for this report. However, ECELS used items with low compliance on the ECELS-FCCH instrument to target interventions. Items for which compliance was reported to be below 50% at posttest are listed in Appendix C4.

The Study Questions: As described under the objectives above, self-assessment and access to the basic services offered by ECELS led to many improvements in reported compliance with health and safety practices. Further, linkage with a Nurse-Consultant for a year did augment reported compliance associated with self-assessment and access to the basic services offered by ECELS.

Other Accomplishments: The American Academy of Pediatrics is intensively working to secure a medical home for every child. Child care facilities can be partners in solving access problems. In April, 1993, the ECELS Director led a mid-Atlantic regional conference on "Securing a Medical Home for Every Child." At the conference, the leaders of six states and the District of Columbia exchanged ideas and set state action plans to improve access to care for children. The Pennsylvania plan includes working with the data on immunization and screening services tracked by ECELS to target interventions.

Shortfalls and Problems: The evaluation component of the project was ambitious for the available resources. Except for the family child care homes, ECELS has no objective observations to confirm the data. The non-random assignment of the sites to the linked and delayed-linked groups confounded the results of the study of the impact of

ERIC

the Nurse-Consultants. The attrition of the sample over the course of the study decreased the power of the study.

No data were collected on race or ethnicity of individuals served or trained. However, subjectively, the proportions of minority groups involved appeared to reflect their distribution in the populations served.

Building the capacity to deliver the ARC Child Care Course took much more effort than originally anticipated. The PA Association for the Education of Young Children advertised the availability of the training. ARC certified successful participants and rented the necessary equipment to ECELS. However, most of the work of arranging for the site, equipment, instructors and confirmation of attendance fell to ECELS. Scheduling was complicated by limited availability of equipment and personnel. A VCR and manikins are required to teach the Infant and Child First Aid Unit. For this popular unit, at least two instructors per session are usually required.

Overall, demand for the ARC training greatly exceeded the resources allocated to it. The actual cost for the Infant and Child First Aid unit is \$40/participant. ECELS used grant funds to train and pay the honorarium and expenses of instructors, buy manuals and supplies, and rent equipment.

These problems were overcome by subcontracting with the ARC chapters to deliver training and setting up computer (PARADOX) soft-ware to match instructors, training participants, ARC chapters and equipment. Although thousands of units of training have been delivered, a waiting list for training remains.

VI. PUBLICATIONS/PRODUCTS

JOURNAL ARTICLES (Copies are included in the Appendices)
Aronson, Susan "Immunization Dose Count Table." Young
Children, 46(6):19, September, 1991.

Aronson, Susan "Promoting Children's Health and Safety Through Child Care" Child Care ActioNews, 8(6):1,6,7, November-December, 1991.

Aronson, Susan "Role of the Pediatrician in Setting and Using Standards for Child Care" <u>Pediatrics</u> 91:239-243, January 1993.

American Academy of Pediatrics, Early Childhood, Adoption and Dependent Care Committee "The Pediatrician's Role in Promoting the Health of Patients in Early Childhood Education and/or Child Care Programs" Pediatrics 92:489-492, September, 1993.

CONTRIBUTION TO BOOKS (Copy not included in the Appendix)

American Public Health Association, American Academy of

Pediatrics. Caring for Our Children. National Health and

Safety Performance Standards: Guidelines for Out-of-Home

Child Care Programs. Washington, D.C.: American Public

Health Association, American Academy of Pediatrics, 1992.

Appendix G and many parts of the text are based on the work

of ECELS. The participation by the Project Director of

ECELS as a member of the Central Steering Committee and the

editing committee for the standards provided many

opportunities to incorporate concepts, approaches and

materials from ECELS. Copies are available from the American

Academy of Pediatrics, 141 Northwest Point Blvd., Elk Grove

Village, IL 60009.

MANUALS/BOOKLETS/BROCHURES (Copies are included in the appendices)

Model Child Care Health Policies: a fill-in the blank set of health policies developed in response to the lack of health policies reported by participating child care programs (based on the 1992 AAP/APHA Standards for Out-of-Home Child Care). ECELS distributed the model health policies to facilities in Pennsylvania by ECELS using CCDBG funds. They are nationally distributed by the National Association for the Education of Young Children, 1509 16th Street, NW, Washington, DC 20036-1426.

Preparing for Illness This booklet for parents and providers was prepared by the Early Childhood Committee of the PA AAP with staff support from ECELS. Copies of the booklet were distributed in Pennsylvania to all regulated early childhood facilities by ECELS and nationally by Cigna Insurance company to Cigna Clients. This booklet is available from the National Association for the Education of Young Children. (See address for NAEYC above.)

Immunization Checking Curriculum A curriculum for training child care licensing staff how to assess immunization completeness using immunization dates and the child's birth date. Copies are available from the PA AAP at cost.

Health Consultant Training Curriculum A curriculum for training nurses on how to be health consultants for child care programs. The curriculum is based on the analogy of the problem-oriented approach to patient care where the child care program is viewed as the patient. Copies are available from the PA AAP at cost.

Powdered Formula for Babies on the Go A brochure instructing parents and caregivers about the use of powdered formula to improve sanitation and safety when infant formula is used outside the home. Copies will be available from the PA Department of Health, P.O. Box 90, Harrisburg, PA 17120.

NEWSLETTERS

Health Link 14 issues as of Summer, 1993. Back issues and disk copies (Ventura software) are available at cost from the PA AAP. Subscriptions for future issues are also available from the PA AAP.

DEVICE

Immunization Dose Counter A slide-rule type of device to aid in evaluating immunization completeness by counting doses of vaccine for age. (See attached.) Immunization Dose Counters are available from the American Academy of Pediatrics for the cost of mailing. (See AAP address above.) The Immunization Dose Counter was nationally distributed by the American Academy of Pediatrics and the National Association for the Education of Young Children. Nearly all of the original printing of 240,000 Immunization Dose Counters (under a grant from the MERCK Vaccine Division) are in the field.

VII. DISSEMINATION/UTILIZATION OF RESULTS

This report will be submitted to ERIC. As indicated elsewhere in this report, many organizations and publications are already disseminating and utilizing the work of ECELS. Currently, ECELS is working actively with staff in the states of New Jersey, North Carolina, and West Virginia on replication of ECELS. Substantive exchanges

have taken place with California, Arizona, Indiana, Ohio, Wisconsin, Washington, Maryland, Missouri, Texas, New Hampshire, Massachusetts, Virginia, and Oklahoma. Utah is attempting to implement the ARC training initiative. In collaboration with the Better Care for the Babies Project of Zero to Three, and the French-American Foundation the Director of ECELS shared materials and approaches in Florida, North Carolina, and Illinois. The American Public Health Association is also disseminating the findings in the project to implement Caring for Our Children. The National Governor's Association, The Child Care Action Campaign, and the US Department of Agriculture have publicized ECELS.

VIII. FUTURE PLANS/FOLLOW UP

From the outset, ECELS sought to secure the future of successful interventions. Commitments for collaboration within the state with support of the project after the demonstration period were included in the initial grant application. ECELS is now a part of the roster of state-funded quality improvement services for child care. The Child Care and Development Block Grant was only a political aspiration when the project began, but has become the primary funding source for ECELS. Some Title V Maternal and Child Health Block Grant funds are being combined with CCDBG funds to work on inclusion of children with special health needs in all types of early childhood facilities.

ECELS is providing consultation for replication of the project by other states. The Director of ECELS was a consultant at two meetings of key leaders in New Jersey. The New Jersey leaders have planned a third to formulate next steps. These meetings were organized by a state-wide coalition of child care and health leaders with input from the director of ECELS. North Carolina held the second of two leadership meetings supported by consultation from the Director of ECELS. West Virginia has a pediatrician who is working with their state extension service to implement ECELS with support from the project staff.

Internationally, ECELS instruments are being evaluated for possible use to improve environmental safety and health in French child care programs. Materials produced by ECELS, have been shared with Ukrainian pediatricians who work with Detsky Sad (child care) in that country.

X. TYPE/AMOUNT OF SUPPORT AND RESOURCES NEEDED TO REPLICATE
The budget for ECELS determines the scope of services that
can be offered. At the present time, the work of ECELS is
sustained by a budget of \$350,000 from the PA Department of
Welfare and \$60,000 from the PA Department of Health.
During 1992-93, an additional \$300,000 was used to fund
direct training and distribution of materials to child care
sites across the state. A \$10,000 grant from the

Pittsburgh-based Jewish Health Care Foundation for development of lead poisoning education materials for child care providers has been approved.

Present staffing of ECELS consists of a part-time pediatrician director, a masters-level educated nurse who coordinates the program on a day-to-day basis, a part-time nurse who coordinates training and technical assistance, 2 secretaries and intermittent support from nurse consultants in the field who work on special projects. Additional staff are hired on a per diem basis to achieve training objectives and to develop new initiatives to assist child care providers with inclusion of children with special health care needs and education around prevention of lead poisoning.

APPENDIX C4

Data Tables

Family Child Care Homes - Items with <50% Compliance

	POST TEST COMPLIANCE FOR 20 FAMILY CHILD CARE HO Items with < 50% compliance	MES	
Item #	Item Description and Weight (H = greatest risk, M = medium risk, L = low risk)	n	%
	Risk Area: INJURIES	<u> </u>	
ES4222	Broken equipment accessible to children (H)	16	43.7
ES4228	Play area near hazards, ditches, wells, heavy traffic (H)	.18	50.0
ES4229	Swimming pools fenced with a locked gate (H)	6	50.0
ES3034	Date of most recent site self-inspection within one month (M)	20	10.0
FA4143	Syrup of Ipecac on hand (H)	19	21.0
EE3130	Most recent fire drill not > 1 month ago (H)	20	0.00
EE2B047	Emergency contact information for children verified within past 6 months (H)	20	50.00
ES2262	Exterminator does not apply pesticides on surfaces used by children or in contact with food(H)	8	12.5
ES2265	Children are not present when exterminator applies chemicals (H)	8	12.5
ES2264	Chemicals used to control pests are known and approved for use in child care (H)	11	9.0
ES4225	Playground surface is a cushioning material recommended by the USCPSC (H)	17	29.4
T4231a	Children ride bikes wearing helmets (H)	11	18.1
	Risk Area: INFECTIOUS DISEASE		
SH4066	Staff wash hands after diapering/toileting (H)	6	50.0
ES2B051	Trash stored in sturdy metal/plastic container (H)	20	50.0
ES2B109a	Pool water is tested (pH) to monitor pool water sanitation (H)	13	23.0
ES2B108	Unfiltered wading pools are not used for multiple children (H)	20	35.0
ES4059b	Changing table sturdy, adult height with railings, not easily contaminated straps, to prevent falls (H)	11	27.0
ES4059c	Soiled diapers/training pants are not washed out by the caregiver (H)	13	15.0
ES4059f	Children's hands are washed after each diaper change (H)	13	38.0

	POST TEST COMPLIANCE FOR 20 FAMILY CHILD CARE HO items with < 50% compliance	MES	
RC3049	records for DTP immunization up-to-date (H)	20	20.0
RC3050	records for polio immunization up-to-date (H)	20	30.0
RC3051	records for Hib immunization up-to-date (H)	20	35.0
RC3035	records for TB screening of adults in the home show screening not more than one year ago	18	5.50
	Risk Area: HEALTH PROMOTION	<u> </u>	
CD2B038	Developmental assessments are routinely performed for children at least semiannually (L)	20	50.0
DH2240	Children known to receive fluoride either in drinking water or in supplements at home or at program (L)	20	30.0
DH4061	Children receive oral hygiene during the child care day (M)	20	20.0
DH4063	A drink of water offered to children over 6 months of age who do not brush their teeth after eating (M)	19	15.7
N4064a	Formula brought to the child care home in a factory- sealed container (M)	7	42.8
N2B030	Parents are given a copy of the menu used in the program (L)	19	21.0
N4072	Family-style food service for children over 18 months who can feed themselves (L)	20	10.0
N4045	First serving by children, not caregiver, with caregiver help if necessary (M)	9	11.1
N2B027	Caregiver eats with children (L)	20	40.0
N4047	Foods served at breakfast include milk, fruit (or juice) or vegetable, grain product	3	33.3
N4048	Foods served at a.m. snack do not include highly processed foods (M)	3	33.3
N4050	Foods served at p.m. snack do not include highly processed foods (M)	3	33.3
RC3034	Child health record includes health history (M)	20	45.0
RC3042b	Child health record includes speech/language screening (M)	20	40.0
RC3043a	Child health record includes hearing screening (M)	20	35.0
RC3046a	Child health record includes anemia screening (M)	20	5.0

	POST TEST COMPLIANCE FOR 20 FAMILY CHILD CARE H Items with < 50% compliance	OMES	
RP2B063	Provider has a routine way to inform parents about routine health services recommended by the AAP and required for participation in child care (M)	20	36.8
RC3034	Staff health assessment is on file	18	5.50
RC3039	Child abuse clearance is on file	18	11.1

Discussion and Details of Data Analysis

Item-by-item Analysis

The tabulated data are listed alphabetically by item in the printouts titled "Listing for Rocky Feuer." Each item is labelled with letters that indicate an area of the health component measured by the item. The first number indicates the part of the instrument where the item is found (1-4). The last numbers in the label indicate the number of the item within the part of the instrument. Many items measure more than one part of the health component. However, for the listing, only one designation was generally used. For some items, the listing letters were changed between the 1990 and 1991 instruments. These items are listed on a separate listing, also titled "Listing for Rocky Feuer." For more explanation of the format of the instrument and use of symbols, see the explanations in the instructions to users at the beginning of the ECELS-C and ECELS-FCCH instruments.

Hypothesis 1: Compliance rates will improve between the 1990 and 1991 surveys for the study group as a whole.

The variables used to test the first hypothesis are:

pcomp90 = percent of compliant sites in 1990
pcomp91 = percent of compliant sites in 1991

numsw = number of sites that switched compliance from 1990 to 1991, either from non-compliant to

compliant or compliant to non-compliant

numgto = number of sites that switched (gained) from non-

compliant to compliant

numlto = number of sites that switched (lost) from

compliant to non-compliant

psign = p value for the sign test

Stated mathematically, hypothesis 1 tests:

Ho: pcomp90 = pcomp91

versus

Ha: pcomp90 (not =) pcomp91

Since those sites that did not switch do not contribute to the change in compliance rates from 1990 to 1991, this hypothesis is equivalent to testing:

Ho: numgto/numsw = 0.5

versus

Ha: numgto/numsw (not =) 0.5

The statistical test used is a sign test, which is used as a small sample version of a McNemar test. The McNemar test is used to test for marginal homogeneity of two binary correlated variables.

The linked sites will show greater gains in Hypothesis 2: compliance between 1990 and 1991 than the delayed-linked sites.

The variables used to test the second hypothesis are:

pcomp90L percent of compliant sites in 1990, linked in

1990 with a health consultant (linked)

percent of compliant sites in 1991, linked in pcomp91L =

1990 with a health consultant (linked)

percent of compliant sites in 1990, linked in pcomp90DL =

1991 with a health consultant (delayed-linked) pcomp91DL = percent of compliant sites in 1991, linked in

1991 with a health consultant (delayed-linked) numswL number of linked sites that

compliance from 1990 to 1991, either from noncompliant to compliant or compliant to non-

compliant

% of linked sites that switched from nonswpcL compliant to compliant (positive switch) among

the total number of sites that switched

number of delayed-linked sites that switched numswDL

compliance from 1990 to 1991, either from noncompliant to compliant or compliant to non-

compliant

swpcDL % of delayed-linked sites that switched from

non-compliant to compliant (positive switch)

among the total number of sites that switched

p value for Two Sample McNemar Test p2sammac

Stated mathematically, hypothesis 2 tests:

Ho: (pc91L - pc90L) = (pc91DL - pc90DL)

(pc91L - pc90L) not = (pc91DL - pc90DL)Ha:

This test is conducted using a two sample version of the McNemar Test. This tests for equal marginal change in two independent 2x2 tables (Feuer et al, 1989). The p value for this test is left blank if there is no improvement in compliance in both the linked and delayed-linked sites.

The p value is left blank if either a) there are no switchers in either the linked or delayed-linked groups, b) all of the switchers in both the linked and delayed-linked groups switched from noncompliant to compliant, or c) all of the switchers in both the linked and delayed-linked groups switched from compliant to noncompliant. In all three of these cases, although the test p value could not be computed, it is clear that there is no evidence that

would lead to the rejection of Ho.

Analysis of the Weighted Scores for the Linked and Delayed-Linked Sites

The question is: Did the weighted scores for the linked sites improve more than the weighted scores for the delayed-linked sites from the pre-test (1990) to the post-test (1991)?

To answer this question, we used an analysis of covariance model (See References in Appendix E.) The dependent variable in this model is the 1991 weighed score. We then tested for a difference between the linked and delayed-linked sites after adjusting for the pre-test score. The variable named "Linked" shows if there is a difference between the linked and delayed-linked sites. For example, for written health policies, the linked sites improved more than the delayed-linked sites, however, the model indicates only moderate statistical significance (p = .06). The graph shows the observed 1990 and 1991 data points for all 67 sites as well as the modeled relationship between the 1990 and 1991 scores for the linked and delayed-linked sites. The model indicates that for the linked sites:

1991 score = 12.60 + 0.71 (1990 score),

and for the delayed-linked sites:

1991 score = 2.97 + 0.71 (1990 score).

The implication is that for a specified 1990 score, the 1991 score is (on average) 9.62 units higher for a linked site than for a delayed-linked site.

Note that the modeled lines for the linked and delayed-linked sites are parallel. This is not always the case. For example, in the model for transportation, we added an extra term to test for lack of parallelism. This term ("LXS90_7") while only marginally significant (p = 0.075), suggested some lack of parallelism. The model for a linked site:

1991 score = 21.38 + 0.63 (1990 score),

and the model for the delayed-linked sites:

1991 score = 46 + 0.33 (1990 score).

The modeled lines indicate that a different conclusion must be made for different values of the 1990 score. For low values of the 1990 score, the delayed-linked sites improved more than the linked sites. For example, for a 1990 score of 30, a linked site would have an average score of 40, while a delayed-linked site would have an average score of 56. However, for high initial scores, there is

a ceiling effect. In this case, both the linked and delayed-linked were about the same (and actually may have declined from their 1990 levels). This type of phenomenon is common when there is a maximum possible score (in this case 100). The same ceiling effect is found in the weighted scale for child development/sexual abuse/parent involvement as shown on the graph.

Two other weighted scales demonstrated parallel models where the linked sites had marginal improvement over the delayed-linked sites. These were Documentation of Routine Health Services (p = 0.156) and Staff Health (p = 0.126).

The results for all of these analyses were only marginally significant, and may be in part due to the low power to detect differences because of the moderate sample sizes (38 linked sites and 29 delayed-linked sites).

The Pediatrician's Role in Promoting the Health of Patients in Early Childhood Education and/or Child Care Programs

Committee on Early Childhood, Adoption, and Dependent Care

American families are changing; more parents are working, and most young children are being cared for in some form of child care. To promote optimal child health and development, pediatricians should work not only with parents, but also with other caregivers, agencies, and organizations that are part of the child's and family's support system. This statement discusses the roles pediatricians should play in the care of infants and young children enrolled in early childhood education and child care settings.

ADVISING FAMILIES

Beginning at the prenatal visit and at each subsequent visit, the pediatrician should review the plans and arrangements that parents may have made for alternative care of their children. The child's adaptation to these arrangements should be reviewed.² The pediatrician should discuss with parents how they are balancing their work and family life. As a trusted family advisor, the pediatrician can help parents identify, evaluate, and choose among their child care

Adjusting Work and Schedules and Getting Help From Employers

When both parents work, they can sometimes coordinate their work hours to share the child's care or make arrangements with their employers to provide some child care at the work site. One or both parents might be able to arrange for part-time work while the children are very young. Some parents may want to share care with another family by staggering work and child care hours. Some families have relatives who are able and willing to provide good-quality, low-cost child care. One or both parents may be eligible for financial help from their employers for child care in community facilities.

Seeking Options for Out-of-Home Care

Once parents determine when they need child care, the pediatrician can discuss what type of care is developmentally appropriate for the age and temperament of the child. Some of the following out-ofhome options may be better for individual children than others.

This statement has been approved by the Council on Child and Adolescent Health.

The recommendations in this policy statement do not indicate an exclusive course of treatment or serve as a standard of medical care. Variations, taking into account individual circumstances, may be appropriate.

PEDIATRICS (ISSN 0031 4005). Copyright © 1993 by the American Academy of Pediatrics.

1. Small family child care homes provide care for six or fewer children in the caregiver's home. Although family child care tends to be isolated and unsupervised, this setting may be most appropriate for children who need a smaller, more intimate group.

2. Large family child care homes operate in someone's residence with more than one caregiver responsible for a group of 6 to 12 children at any one time. With two caregivers, backup for emergencies and mutual caregiver support are available.

3. Centers provide part-day or full-day programs of care and education for 13 or more children at one time. Well-run child care centers offer developmentally appropriate care and coordinated family support services.3

The name of the program does not define the type of service provided. Early child care and childhood education programs operate under many names, eg, Head Start, nursery school, preschool, early learning program, play group, child (day) care program, and baby-sitting service. Some programs care for children when they are ill; others strictly exclude children with any symptom of disease. Pediatricians should suggest that parents inquire whether a child care program serves only healthy children or allows children to attend with mild illnesses.

Parents of children with disabilities may need extra help in finding and adapting child care arrangements to meet their family's needs. These parents often bear a heavier financial, physical, and emotional burden than other parents. Supportive child care services not only free these parents for employment, but also reduce the stress of caring for a child with special needs. Pediatricians should review with parents and prospective caregivers the special facilities, procedures, and personnel required by the child.

Helping Parents Choose Child Care

Parents will value practical advice about how to evaluate and choose among the child care and early education options available to them. Pediatricians can advise parents to look for quality by observing staff-child interactions, the staff-child ratio, and group size. Caregiver qualifications, operating procedures, and facility design should be checked to be sure the program will be safe, nurturing, and capable of enhancing the child's growth and development. Unfortunately, many parents choose child care for cost and convenience, rather than for quality. Bro-

chures that contain checklists to evaluate child care programs are available from the American Academy of Pediatrics (AAP) and the National Association for the Education of Young Children. 4-6 Pediatricians should urge parents to call their local child care resource-and-referral agency or license agency for information about specific services in the community.

Planning for Illness

Working parents need a plan for child care when their child is ill. Pediatricians should be sure families and their child care programs know how to judge when a child's illness requires exclusion from the child's regular care arrangement and when the child may return. The pediatrician can offer to review written health policies on management of illness used by the child's caregiver to check that they are medically appropriate. When a child is seen in the office for illness, the pediatrician should discuss whether and for how long the child needs to be excluded from child care. Visits to the pediatrician's office for the purpose of obtaining a note to certify that the child is well are costly to parents and rarely necessary. Physicians should provide information on sources of inhome or out-of-home sick child care for families in which a parent is unable to remain at home when the child is ill.

COMMUNICATION WITH CHILD CARE PROVIDERS TO PROMOTE THE HEALTH OF INDIVIDUAL CHILDREN

Communication among pediatricians, parents, and caregivers enhances the quality of care for children. Pediatricians are often asked to complete an information form for the child care center at routine preventive visits. The presentation of the form by the parent is a cue to ask the parent about the child care arrangement. In completing the form, the pediatrician should share with the caregiver information about the child's medical status, temperament, and special characteristics. Similarly, caregivers should be encouraged to share their valuable observations of the child and family with the child's physician by sending a note with the parent or, with parental consent, by calling the pediatrician to discuss concerns about the child. Parents are usually responsible for carrying information between health and education professionals. However, with prior approval from the parents, direct communication between the pediatrician and the caregiver by telephone or note may be more efficient and effective.

Information should be shared about the child with a chronic disease, the child who is developmentally immature, and the child who is having behavior problems. Pediatricians should provide written or telephone instructions to caregivers for children who need special attention while in child care. A prescription label will suffice for medications dispensed by a pharmacist. For over-the-counter medications, special procedures, and diets, the pediatrician may send a note or call the instructions to the child care program.

SERVING AS A CONSULTANT TO EARLY CHILDHOOD PROGRAMS

Operating an early childhood program involves many health issues, but few programs have any regular source of advice from health professionals. Early childhood professionals are often reluctant to ask for help from physicians who they think are too busy to serve as program consultants. Collaborative relationships between educators and health professionals should be built with positive experiences. To be effective consultants, physicians must listen to the concerns of early childhood educators and base their advice on realistic appreciation of the activities, priorities, and responsibilities of early childhood education programs. Child care programs that provide care for mildly ill children and children with disabilities need especially close working relationships with health professionals.3,7 The role of a pediatrician as a health consultant includes:

- discussing the concerns of parents and caregivers;
- providing advice regarding management of an urgent health problem;
- advising about the management of children with special health care needs;
- assuring that each child has a "medical home" for routine ongoing health care;
- identifying authoritative sources of health information and services related to sanitation, immunization, first aid, infection control, staff health questions, etc;
- linking early childhood programs with other health professionals and services;
- mediating disputes about program procedures among different health professionals who give advice to the program since they provide health care for individual children;
- training staff on health issues and identifying health training resources;
- consulting on the development of health education programs for children and parents;
- setting up routine surveillance for health and safety problems; and
- establishing and periodically reviewing written health policies and procedures.⁸

Effective health consultation to an early childhood program usually requires at least one site visit to see how the program operates and to determine what services the program staff desire. After observing the program, the health consultant should meet with key staff to discuss important observations, clarify priorities for further input, and develop plans. Once direct contact has been made, access by phone provides an ongoing link between the health consultant and the early childhood program. Many of the telephone contacts are requests for factual information that can be handled in the same way as parent telephone calls. A productive telephone relationship requires clear instructions to program staff about how to schedule and structure telephone contacts for efficient communication.

Caring for Our Children: National Health and Safety Performance Standards: Guidelines for Out-of-Home Child Care Programs, the health and safety performance standards jointly developed by the AAP and the American Public Health Association, can support the pediatrician who assumes the role of the health consultant to an early childhood program.3 Other resources include various AAP manuals, policy statements, journal articles and other related publications, local AAP chapter early childhood committees, pediatricians who specialize in child development, and health department personnel.8-13 Insurance coverage for community consultation under the pediatrician's medical liability policy should be verified with the carrier. Where coverage is not provided, pediatricians can advocate for mandatory inclusion of these activities in medical liability policies by using model legislation developed by the AAP and the American Medical Association.

ADVOCATING FOR EARLY CHILDHOOD EDUCATION PROGRAMS IN THE COMMUNITY

At the community level, pediatricians can work with parents and other local or state leaders to improve regulation and licensing of early childhood programs. Regulations are ineffective unless they are enforced by competent inspectors and supported by technical assistance to achieve compliance. This is especially true for immunization requirements. Pediatricians should support state legislation requiring immunization of preschool children and, in states where legislation has been passed, assure that early childhood education programs are in compliance with the law. Advocacy for improved licensing and monitoring requires familiarity with state and local regulations, regulatory bodies, and responsible personnel. The previously referenced publication developed jointly by the AAP and the American Public Health Association provides specific recommendations to improve regulations.3

Pediatricians also should advocate to improve the quality of child care by assuring that early childhood professionals receive adequate compensation and training and that appropriate funding is allocated for the care and education of young children. Increased financial subsidy of early childhood programs by society is needed because few parents can afford the full cost of quality child care. Such subsidies are routinely provided for school-age children, but subsidies are not available to the same extent for the care and education of young children.

RECOMMENDATIONS

To promote the health and development of children whose families use early childhood care and education programs, the American Academy of Pediatrics recommends:

The role of the pediatrician should include advising families about how to find and critically assess alternative types of child care and how to judge the potential impact of these choices on the health and development of the child.

2. Recognizing the confidentiality boundaries of parents and the expertise of child care providers, pediatricians should engage in three-way communication with early childhood education professionals and parents to promote the health and development of children for whom the pediatrician provides health care. To do this, pediatricians can complete those health forms requested by child care providers. In addition, pediatricians should solicit information about children with special health and developmental needs from caregivers as well as parents.

Pediatricians should work to improve the quality of child care in their communities by serving as consultants to and as advocates for early child-

hood education programs.

 Pediatricians should work with other advocates to improve the availability of good quality child care choices in the community.

Volume 8, No.

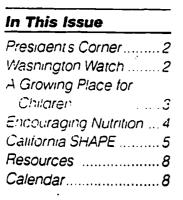

Promoting Children's Health and Safety Through Child Care

ov Dr. Susan Aronson, CCAC Board. Member

All children need protection from injury and infection, both of which can lead to discomtort, disability, or even death. But children need more than simple protection from danger. They need activities that promote healthy development and prevent developmental problems.

Advancing children's health involves traditional health services such as check-ups, immunization, screening tests and diagnostic services, as well as access to nealth care. In particular, children's health services must include good nutrition, dental health measures such as fluoridation, and opportunities to develop fitness habits and learning skills.

Exercise promotes health in many ways and, as a life-time habit, contributes to the

Four-year olds from the Smithsonian Early Enrichment Center are shown participating in age-appropriate exercises at the U.S. Department of Labor Fitness Center in Washington, D.C. Under way for more than a year, this pilot of weekly sessions for preschoolers is being readied for replication.

prevention of heart disease, high blood pressure, lung disease, and obesity. The size and development of children's muscle mass and the amount of body fat are significantly affected by exercise.

A child's age is a key factor in determining appropriate health practices. Nourishing physical and emotional development in young infants requires considerably different techniques from those used for toddlers. The quality of child care is diminished when a caregiver is absent or If The old advice about eating right, sleeping right, and exercising to stay fit applies to child care staff, including administrators. Child care professionals must simultaneously function as protectors, role models, and teachers for children, as well as look after their own health and safety as adults.

Preventing the Spread of Infectious Disease in Child Care

The risk of transmission of infectious diseases in child care is a major concern for medical professionals. Reports of outbreaks of illness foster the perception that child care centers are places where germs are routinely passed from child to child. When newspapers or television pick up these reports, parents become anxious and guilty about exposing their

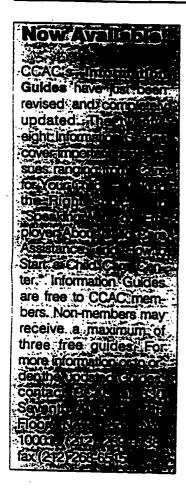

children to a possible in creased risk of infection.

The risk of transmission c infectious diseases is in creased when children of adults are gathered in groups for any reason. Generally children in child care experience the same types of fiec. tion as do children who receive care only at home. Children in child care are occasionally exposed to unusual infections which then have an opportunity to spread and cause outbreaks of disease. However, outbreaks of unusual infectious diseases in child care are rare.

Maintaining a sanitary child care facility reduces the development and spread of infections. Ongoing programs are needed to teach the importance and techniques of hand washing, diaper changing and toileting, and food handling.

Children cannot see, feel, or smell germs, but they can learn to control germs without being frightened or confused. For example, by using a plant sprayer with water in it while children simulate the stunds of a sneeze or a cough smill care providers can help thildren understands from a sneeze or cough spreads germs. Children can learn to turn their heads away from people when they cough

... Promoting Health & Safety

continued from p. 1

since covering the nose or mouth will put germs on their hands to be spread by touching. The technique of having a child turn his or her head into the upper arm can give the cough a cold shoulder. Practicing positive health behaviors as routines helps children adopt these behaviors as lifetime patterns.

Preventing Injury in Child Care

As many as three-fourths of all injuries occurring in child care are easily preventable. Lack of adequate supervision plays a secondary, but important, role to removal or modification of obvious hazards. Inspections of child care centers and family day care homes find well-recognized hazards, such as unsafe surfaces under playground and indoor play equipment. Hazards should be removed from the premises, modified by using special safety materials, or made inaccessible.

Injury, not disease, is the leading cause of death for children after the first year of life. Recent studies show that children experience medically treatable injuries in child care centers less frequently than when parents are providing care themselves. Moreover, injuries occur more commonly in family cay care homes than in a child's own home. Although the majority of injuries that children experience in child care are

minor, the ones that are serious enough to require medical attention most often occur in gross motor play areas, such as on playground equipment.

Causes of injuries to children vary by the age level of the children involved. Reducing injuries can best be accomplished by methods that do not require a child to think or make conscious choices. For example, designing driveways that do not cross pedestrian walkways is a more effective means of preventing children from being struck by cars than teaching children to scan for cars before crossing driveways. When no passive means of reducing risk is possible, children should learn about safety and practice safe behaviors until they become rou-

Health Care Workers and Child Care Providers

Health professionals recognize the beneficial impact of preventative measures enacted through partnerships formed with early childhood educators and with parents.

The Pennsylvania Chapter of the American Academy of Pediatrics (AAP) has developed a statewide project called the Early Childhood Education Linkage System (ECELS). ECELS provides professional health consultation, training and technical help to improve the quality of early childhood education programs in Pennsylvania.

The Pennsylvania AAP organized ECELS with the aid

of the staffs of the Pennsylvania Departments of Health, Public Welfare, Education, and with the Office of the Govemor, Region III Head Start Program and the U.S. Public Health Service. The project currently receives grants and contributions from the public sector and from private foundations. A statewide advisory committee of representatives from a wide variety of agencies and professionals in the public and private sector quides ECELS

The early childhood programs targeted by ECELS include more than 9,000 Head Start programs, child care centers; family day care homes, group homes, and nursery schools. About 250,000 children, infants, toddlers, and preschool children attend these programs in Pennsylvania, many of which operate with little or no input from health professionals. ECELS supports existing relationships and develops new linkages between health professionals and early childhood programs. More than 700 experts in pediatrics. public health, dentistry, mental health, and nutrition have volunteered to work with ear-

ly childhood programs. Using a computer registry, ECELS links them with local programs.

ECELS also provides resources on health issues to child care providers. In cooperation with the Pennsylvania Chapters of the American Red Cross and the Association for the Education of Young Children, ECELS helped train nurses as Red Cross Child Care Course Instructors and arranged for statewide caregiver training. ECELS offers a toll-free telepnone line where early childhood program staff receive advice about health and safety. Materials can be borrowed from a free audio-visual lending library. In cooperation with the Pennsylvania Department of Health, ECELS also distributes a quarterly newsletter, "Health Link," to every licensed or registered early childhood program in the state

During 1990, a sample of 148 randomly selected early childhood programs and 106 nurses participated in activities to test whether nurseconsultants could improve the quality of child care pro-

grams. The nurses received training from the Pennsylvania AAP on how to be health consultants and ECELS linked each nurse-consultant with a local child health physician who provided advice as a volunteer. Each participating program completed an annual self-assessment and after scoring and coding the data, ECELS prepared profiles listing the standards that an individual program failed to meet. These profiles were used by the programs to formulate corrective action plans.

ECELS used pooled pretest data from the programs in the statewide sample to identify some common problems requiring statewide strategies and solutions. Among the areas targeted for special interventions during 1991 were: immunization, child care and food service staff training, model health policies, playground safety, traffic and fire safety education, and dental health.

The ECELS program presents a model of effective partnerships between health care workers and child care providers. By providing health care advice and assistance to child care providers. health care workers can help improve children's health and safety.

Dr. Susan Aronson is currently Clinical Professor of Pediatrics at Hahnemann University, and a practicing pediatriciar in Pennsylvania. Additionally, Dr. Aronson is a Fellow of the American Academy of Pediatrics and a consultant on child health issues. This article contains excerpts from Dr. Aronson's latest book. ... A Growing

Place

continued from p. 3

Parents are a valuable resource for child care providers. Often parents are the experts on the best way to feed or lift their child, and are eager to share information with a caregiver.

How does children with disabilities affect other children in the program?

Before we accept any child into the program we look a the individual child and con sider the structure of the over all group, and the demands on staff. We had one child in the program who couldn': stand and he got around by rolling. For a while all the kids tried rolling as a way of experiencing what they saw and exploring their own abilities. The staff doesn't separate out the children with disabilities from the other children, so all the children get the message that differences are acceptable.

Children with disabilities are children firstt. At Growing Place we say that every child needs attention as an individual regardless of his or her abilities.

Role of the Pediatrician in Setting and Using Standards for Child Care

Susan S. Aronson, MD

ABBREVIATIONS. APHA, American Public Health Association; AAP, American Academy of Pediatrics; ECELS, Early, Childhood Education Linkage System.

Standards for child care settings define expected performance. Other types of requirements applicable to operation of child care facilities include funding requirements, accreditation criteria, and regulations (legal requirements). During licensing inspections, program monitoring by funding agencies, evaluations by accrediting organizations, and self-evaluations, programs become aware of opportunities for improvement. The process of evaluation alone leads to improved program performance¹; the majority of providers want to do a good job.

When requirements are used for systematic surveillance, the compliance data generated identify problems to be targeted for quality improvement. Training, technical assistance, linkage to existing resources, and development of new resources are common interventions that lead to improved performance in child care programs. These interventions may be applied at the level of an individual child care facility or at any level involved with child care services. Thus, training and technical assistance may be given to caregivers, to licensors, to policy makers, or to the public.

A surveillance system should continuously measure the impact of interventions and focus attention on problems that require further corrective action. When performance data from individual programs are aggregated, they provide powerful tools to assess the need for communitywide interventions. Some changes cannot be accomplished within the limited resources of an individual child care facility. Sometimes program improvement requires one or more types of intervention at the community, regional, state, and/or national level.

Updating requirements, conducting surveillance to measure compliance with requirements, and analyzing data to target interventions and measure the impact of actions on program performance are the basic elements of a systems model for improving quality in child care (see Figure). Each element of this systems model offers opportunities for pediatricians to serve as advocates for children.

AMERICAN PUBLIC HEALTH ASSOCIATION/ AMERICAN ACADEMY OF PEDIATRICS STANDARDS

Increasing numbers of health professionals have become aware of potential health risks and benefits to children who are in group care. Without the input of health professionals, many opportunities for prevention of injuries, prevention of infectious diseases, and health promotion are missed in group care of young children. Over the past 50 years, a variety of national guidelines have been written by a number of organizations, but none included broad input from

health professionals.

In a federally funded, 4-year project, the American Public Health Association (APHA) and the American Academy of Pediatrics (AAP) responded to the lack of health and safety guidelines for operation of early childhood care and education programs by developing the National Health and Safety Performance Standards: Guidelines for Out-of-Home Child Care Programs.2. These standards can be applied at each level of the systems model for improving quality in child care. They can be used by providers of child care as a reference on how to handle specific aspects of program operation. They form the basis for development of other types of requirements and for drafting of surveillance tools to measure compliance with requirements. They are also a good reference for health professionals who serve as consultants to group-care programs for young children. In addition, the APHA/AAP standards are useful tools for policy makers who allocate resources for publicly supported services and quality-improvement activities.

The process leading to the publication of the standards was long and arduous. In the first 2 years of the project, a Central Steering Committee appointed two subcommittees: a Survey Subcommittee and a Standards Subcommittee. The Standards Subcommittee was made up of the chairs of 10 technical panels. The chairs of the technical panels were national experts who worked with the Central Steering Committee to identify other experts and early-childhood program operators to work on assigned topic areas. Demographic and ethnic balance among the technical panels was sought and achieved.

The topics assigned to the 10 technical panels which made up the Standards Subcommittee were chosen by listing the primary areas where children in group care were at risk. They became the titles of the 10 technical panels (see Table 1).

The Survey Subcommittee was appointed from the membership of the Central Steering Committee. The Survey Subcommittee had two tasks: the review of then-existing state and local licensing regulations re-

requirements standards funding rules accreditation regulations surveillance +--self-evaluation peer-validation monitoring inspections compliance data individual site aggregated community * region state interventions training technical assistance linkage to resources develop new resources

program performance

lated to out-of-home child care and the identification of child care programs with exemplary practices in the content areas covered by the 10 technical panels. A nationwide search for child care programs with exemplary practices was conducted.

Each of the chairs of the 10 technical panels was asked to generate five standards for the Survey Subcommittee to include on a checklist that the Survey Subcommittee would use to review existing regulations. These were called "proxy standards" because they stood in for the requirements that had not yet been written by the technical panels. One criterion for choosing a proxy standard was that the technicalpanel chair expected that its requirements were basic, necessary, and likely to emerge in a final recommended standard. The other criterion was that the technical panel wanted to know the extent of inclusion of the proxy standard in then-existing legal requirements, particularly where it was desirable, above the basic level or reflected new knowledge. Licensing regulations are generally applied to three

types of facilities: child care centers where children receive care in a facility that is used primarily for child care; large family-child-care homes where children are cared for by more than one caregiver in the home of one of the caregivers; and small family-child-care homes where there is only one caregiver and the care is provided in the caregiver's home.

During 1988, current licensing and registration regulations of 50 states and eight cities that license child care centers, 40 states and one city that license large family-child-care homes, and 48 states and five cities that license small family-child-care homes were reviewed for the presence or absence of the 50 proxy standards. The Survey Subcommittee found applicable regulations for centers in all 58 sets of regulations reviewed. Only 53 sets had applicable regulations for small family-child-care homes; only 41 had them for large family-child-care homes. The study of the licensing regulations conducted by the Survey Subcommittee gave a snapshot of the current status of regulation of child care that informed the standard-setting process.³

Many programs with exemplary health and safety practices were found. The existence of programs with exemplary health and safety practices suggested to the Standards Subcommittee that these practices are achievable in the context of day-to-day operation of child care facilities. Information on the way in which these practices are implemented by operating child care programs was included in the published APHA/AAP standards.

To the extent possible, the authors of the standards sought an objective, scientific basis for each standard. Each standard was accompanied by a rationale and, where appropriate, a comment that addressed suggestions on approaches to implementation. When research data documented adverse outcomes which would be avoided by complying with the standard, these data were cited. When no research data were available, the rationale used was the experience and judgment of recognized experts about the risk to be avoided by complying with the standard.

After the panels produced first drafts for their assigned areas, their recommendations were merged and reorganized into a single set of recommended standards. Next, members of the Central Steering Committee negotiated revisions among the panels to achieve consensus. The product of the consensus was then extensively reviewed by groups of intended users and further revised by the technical panels. Finally, the whole document was reorganized again to present the standards in the way child care service providers and state regulators approach program operation. Where the APHA/AAP standards overlapped with the recommendations of other organizations, these other recommendations were crossreferenced and/or included. The APHA/AAP standards are guidelines and are not enforceable as legal requirements on their own. To be enforceable, standards must be adopted as regulations or codes by legal entities with the power to administer sanc-

The standards are organized into chapters that cover staffing, program activities, nutrition, facilities

and supplies, infectious diseases, children with special needs, administration, and recommendations for licensing and community action. Since many of the standards were the work of more than one technical panel, the technical panel source for each standard is no longer explicit in the published document. Now, the general areas recognizable in the standards are preventing injuries, preventing infections, and promoting health (including mental health and develop-

The standard on playground surfacing is a good example of a requirement aimed at preventing injury. The most common cause of significant injury in child care is a fall to a hard surface from equipment for gross-motor play. Often, playground equipment is made and installed without concern for the developmental ability of children using it. When equipment is mounted over surfaces that do not absorb energy, children get hurt.

The Survey Subcommittee looked at existing regulations for a requirement that energy-absorbing surfaces are placed under climbing structures, swings, and slides. This requirement was found to be absent or less stringent than the APHA/AAP proxy standard in 60.3% of the regulations applied to centers, in 70.7% of those applied to large family-child-care homes, and in 83.0% of those applied to small familychild-care homes.

In the published APHA/AAP standards, the requirement for playground surfacing is explicit. 3(p188) Scientific data on incidence of injury and testing of materials to be used to reduce this risk accompany the standard. Installation requirements and examples of the types of acceptable materials are specified.

In the area of preventing infectious disease, a key standard is the requirement for adult hand-washing. The Survey Subcommittee found that the requirement for adult hand-washing at specified times was absent or less stringent than the APHA/AAP proxy standard in 24.1% of the regulations for centers, in 39.0% of the regulations for large family-child-care homes, and in 52.8% of the regulations for small family-child-care homes. In the published APHA/ AAP standards, hand-washing by staff and children is required in all types of facilities before food preparation, handling, or service; after toileting or diapering; after handling pets; and after contact with body fluids.3(p72)

In the area of health promotion, the standards focus on the basic needs of young children. Infants and toddlers need flexible, but regular, individualized routines. They need stable relationships with their caregivers and stimulating learning experiences. Their environments must be safe and designed to facilitate nurturing by their caregivers. Child care is a labor-intensive service. Staffing and group size are key features that determine the ability of programs to follow practices that promote the health of children in their care. Child-staff ratio and group size impact on the ability of the caregiver to interact meaningfully with individual children and to follow health and safety practices such as hand-washing and supervising potentially risky play. Child-staff ratio and group size also have a significant impact on cost.

The proxy standard on child-staff ratio used by the Survey Subcommittee required no more than four infants per adult in centers and no more than two children younger than 2 years of age in a small family-child-care home. In 1988, this requirement was not met in 43.1% of the regulations for centers and in 60.4% of the regulations for small family-child-care

The proxy standard for group size for centers varied by age (as does the published APHA/AAP standard) and was less restrictive than the published standard. The proxy standard for group size in small family-child-care homes was no more than 6 children in the group, and for large family-child-care homes, no more than 12 children in care at one time. In 1988, the proxy standard for group size was not met in 82.8% of the regulations for centers, in 26.8% of the regulations for large family-child-care homes, and in 41.5% of the regulations for small family-child-care homes.

In the published APHA/AAP standards, a familychild-care home with one caregiver may have no more than six children, including no more than two children younger than 2 years of age. If any of the children are younger than 3 years of age, no more than four children may be in care. If all the children in care are younger than age 2, no more than three children may be in the group. The children of the caregiver are to be counted if they are younger than 6 years of age.3(p1)

The published APHA/AAP standard for childstaff ratio and group size in child care centers is shown in Table 2.3(p1) The staffing level for infants gives each caregiver an assignment similar to the experience of a parent who must care for triplets. While one caregiver is feeding or diapering a child, the other caregiver is responsible for five children by

The standard on child-staff ratio was extensively debated. Cost was weighed against concerns for physical safety and child development. The recommendations shown in Table 2 are consistent with the recommendations of other recognized standard-setting bodies in the field of child care. These levels are considered minimal requirements for staffing and are to be combined with training requirements specified in other standards to provide adequate care.

Pediatricians must promote the use of the APHA/ AAP standards in revising regulations and other requirements. While not all the standards will be incorporated, those that address the most significant risks should be given high priority. By explaining the

TABLE 2. American Public Health Association/American Academy of Pediatrics Standards for Child-Staff Ratio and Group Size in Child Care Centers

Age	Child Staff Ratio	Maximum Group Size
Birth-24 mo	3:1	6
25-30 mo	4:1	8
31-35 mo	5:1	10
3 y	7:1	14
4/5 y	8:1	16
6-8 ý	10:1	20
9–12 y	12:1	24

technical rationale for a standard, pediatricians can help build consensus among providers, regulators, and policy makers necessary for adoption of the standard as a legal (regulatory) requirement. Economic competition for scarce public resources and parental inability to pay the true cost of child care must be balanced against the risk to children from poor-quality care. Incorporating high-priority standards as goals of practice is the first step toward improving the quality of service.

SURVEILLANCE

Where appropriate requirements exist, the quality of surveillance must be addressed. Surveillance should consist of systematic, accurate, reliable measurements of compliance with requirements. In a study performed in Colorado, environmental specialists from the health department visited programs 2 weeks after the licensing inspection and compared their findings with those of the licensing inspectors.4 While the licensing inspectors found only 25% of the programs deficient, the reinspection by the environmental specialists found that 94% of the programs were not meeting requirements for safe playground equipment or for reporting outbreaks of disease. Hot-water temperatures were above the permissible limit in 72% of the programs. The requirement for weekly sanitization of toys was not met by 76% of the programs. Toxic chemicals were accessible in 68%. Diaper areas were not sanitized as required in 65% of the programs; staff/child hand-washing was inadequate in 57%.

Much has been written about empowering parents as the primary means of maintaining surveillance. Unfortunately, many parents either do not recognize or overlook dangers to which their children are exposed. Because of their obligations as adult workers, parents seek child care at an affordable price, that is reasonably convenient, and thus may not be rigorous in evaluating quality. Many expose their children to hazards in their own homes and do not see these same conditions in child care as objectionable.

The role of pediatricians in improving the quality of care of children includes promoting the use of standards for meaningful surveillance systems. At the local and state level, pediatricians can promote self-evaluation, incentives for accreditation, and systematic checking of facilities by well-trained inspectors. By calling for systematic measurement of compliance, pediatricians can foster the development of a database to identify and implement needed interventions.

ANALYSIS AND USE OF COMPLIANCE DATA

Pediatricians should make themselves available for interpretation of individual and aggregate performance data and participate in problem-solving to improve the quality of care. This role may involve giving technical advice, participating in staff training, and linking child care programs to community health resources. In addition, pediatricians should use compliance data in their role as advocates for development of new resources to improve the quality of child care.

Quality is related to cost. Because early-childhood programs are badly underfinanced, care is being subsidized by low wages of caregivers. The result is high staff turnover. Caregivers earn much less than their same-sex, comparably educated counterparts in other educational settings. Few can afford to remain in the profession for long. With high staff turnover, no effort to improve the quality of child care will make much difference.

Regulations are legal requirements which define the floor below which no program is permitted to operate. This level is set by a combination of forces. Child advocates generally want the regulations to be set at a fairly high level to promote the well-being of children. Funding agencies usually want the regulations to be set at as low a level as possible so that their limited resources can provide as much care as possible. Providers generally want regulations set at a level that parents can afford, but that prevents low-price, low-quality competitors from luring parents to poor care.

As increased funding is provided, child care quality generally improves—to a point. Funding should be sufficient to maintain the legally required regulatory level of performance. To offer less mocks legal operation of child care. Optimally, funding should be at the level that supports compliance with accepted standards.

Currently, child care in the United States is caught in a trilemma in which tension exists among the factors of cost, quality, and affordability. In the laborintensive child care industry, the primary contributor to cost is caregiver wages. Workers in the field of child care earn unacceptably low wages for the skill, knowledge, and intensity of work they do. Consider the skill and labor required to competently nurture three infants, four toddlers, or five preschool-age children day after day. When families are blessed with triplets, quadruplets, or quintuplets, extra helpers are usually sought, so that parents alone will not have to care for so many children at the same time. Yet a caregiver is expected to care competently for many young children during the most active part of the children's day.

Unlike conditions in other developed nations, the social investment in care and education of young children in the United States depends on what parents feel they can pay. For older children, local, state, and federal governments subsidize universal education and recreation services. For children younger than 5 years of age, the youngest and most vulnerable children, all but low-income families are expected to carry most of the cost unaided. Many affluent professional families undervalue and underpay for skilled child care. Even in families where both parents are in the labor force, child care costs are usually weighed against the mother's income rather than the family's income as the test of affordability. Paying to meet the APHA/AAP standards for child care requires a commitment to child care as a service for children as well as a necessity to enable parents to work. Pediatricians should couple compliance data with the rationale for the standards to help policy makers and parents make informed choices, about investing in the care of young children.

WORKING WITH EARLY CARE AND EDUCATION PROFESSIONALS

Child care is necessarily a multidisciplinary operation. Especially with very young children, care and education are inseparable. The integrated model originally espoused as an ideal by Head Start for disadvantaged children is equally applicable to all early childhood settings for a "whole-child-and-family" approach. Some families need more support than others, but all families benefit from a holistic approach to child care that includes health, nutrition, child development and education, parent involvement, and referral to needed social services. Pediatricians and other health professionals must become involved in helping child care provide this holistic approach.

In Pennsylvania, the PA Chapter of the American Academy of Pediatrics is responding to the need for health professional involvement to improve the quality of child care. The chapter established the Early Childhood Education Linkage System (ECELS) in 1990: ECELS provides a hotline for child care providers to call for advice about health and safety issues. The Chapter has raised funds for an audiovisual lending library that providers use for preservice and inservice training for their ever-changing work force. ECELS also links child care programs with health professionals in their own communities, using a computer registry of health professionals who have volunteered to work with child care programs. Often the health professionals find themselves giving advice to caregivers who are responsible for daytime care of their patients.

ECELS publishes a quarterly newsletter for caregivers and health professionals who work with child care to communicate updated information on practices and resources to improve the quality of care. Through liaison with other community organizations, ECELS facilitates access to health and safety training resources in the community, such as the American Red Cross Child Care Course. ECELS also works with policy makers to educate them about ways to improve the quality of child care.

Some volunteer pediatricians in the PA Chapter develop informational materials for distribution to caregivers. Others work with the licensing agency to revise the regulations, participate in training, and advise licensing inspectors on health issues. ECELS uses data generated from self-assessments and regulatory inspections to formulate plans for corrective action, with the help of a statewide advisory committee composed of representatives of government agencies, health professional organizations, and child care providers.

ECELS has recruited more than 700 Pennsylvania health professionals to work with child care programs. Nurses who have a physician to provide technical backup seem to enjoy their roles as frontline consultants for child care programs. Successful consultation on child care issues involves use of the familiar problem-oriented approach to patient care.

Think of a child care program, state regulatory agency, or surveillance system as a patient. Subjective and objective data must be gathered, an assessment made, and a plan for further diagnosis of the problem, for treatment, and for education of the client formulated. Over a period of time, the consultant who sustains a continuing relationship can observe that programs grow, mature, and manage many challenges.

Serving as a consultant is a rewarding role for a child-health advocate, but there are drawbacks. Few child care programs can pay much for consultation. Medical liability insurance coverage for the role of program consultant must be checked. Although no case law is known to exist where a consultant has been sued for advice provided to a child care program or agency, health professionals should ask for confirmation that their carriers consider this role as a covered professional activity.

Through projects like ECÉLS in Pennsylvania, and work now under way in many other AAP chapters, consultation is being provided by pediatricians to state government for systemic change in child care. In Florida, Illinois, and Utah, the National Center for Clinical Infant Programs is providing technical assistance to state governments to foster collaboration among health and child care professionals. Support and exchange of ideas among pediatricians are occurring through the AAP chapter network and in round tables sponsored by the AAP Committee on Early Childhood, Adoption, and Dependent Care at national AAP meetings.

The health needs of school-age children is a well-established focus for pediatric input and for nursing support. Programs that serve younger children, who are inherently more vulnerable, tend to lack this focus. No established system exists to regularly involve health professionals in early care and education programs. Elsewhere in the world, health professionals are intimately involved with child care at every level, from operations to policy setting. Pediatricians and other health professionals must develop the mechanisms to collaborate with early childhood educators/caregivers, regulators, trainers, and policy makers to improve the quality of child care in the United States.

NAEYC's standards for accreditation require a current written record of imminizations. Immunizations are virtually a universal state licensing requirement for children enrolled in child care programs. The table below has bee developed to ease the task of assessing the completeness of a child's record of vaccinations. We ask those using the table to provide feedback on its effective ness to NAEYC's Information Services department.

EARLY CHILDHOOD IMMUNIZATION DOSE COUNT TABLE

This table is to be used to check a child's immunization record for completeness. It is based on the routine schedule recommended by the American Academy of Pediatrics and the Centers for Disease Control of the U.S. Public Health Service. A health professional must individually evaluate the record of any child who has not been immunized according to the routine schedule.

Young Children • September 1991

^{**} Three different types of Hib vaccine are currently available. Each has a different doze schedule. Children over 5 years of age are not usually given Hib vaccine. Since the records maintained by parents often do not specify the type of Hib vaccine used, the completeness of a child's Hib immunization status should be certified by the child's health provider.

^{***} In areas where an outbreak of measles has occurred, single antigen measles vaccine (not MMR) is advised by the health department at 6 months of age. These children should still receive MMR at or after 12 months of age. In some areas measles vaccine is routinely given at 12 instead of 16 months of age.

^{****} A second dose of measies vaccine or MMP is recommended at a siter 12 months for children who received a cose before 12 months of age. Another dose of measies vaccine received to second, but the form for those who received a first dose before 12 months) or MMR may be required before school entry in some areas.
